Our service guides reflect the latest version of the Fastly web interface. Service guides for the classic web interface can still be accessed at [docs-legacy.fastly.com](https://docs-legacy.fastly.com). For more information see our announcement ([/changes/2016/11/17/special](https://docs-legacy.fastly.com)).

## API (/api/)

### Authentication (/api/auth)

You authenticate to the Fastly API in one of three ways: via API tokens, API key, or a session.

### API tokens

API tokens are unique authentication identifiers that you can create for the users and applications authorized to interact with your service. You can scope the authorization of tokens to a single service, and you can restrict access to purge all by limiting tokens to purging by URL and surrogate keys. Because users can create multiple API tokens, you can rotate tokens without taking services offline, and you can revoke individual tokens without having to update other API integrations.

**IMPORTANT:** This feature is part of a limited availability release. For more information, see our product and feature life cycle ([/guides/customer-support/product-and-feature-life-cycles#limited-availability](https://docs-legacy.fastly.com)) descriptions.

### Two-factor authentication

API tokens support two-factor authentication ([/guides/account-management-and-security/enabling-and-disabling-two-factor-authentication](https://docs-legacy.fastly.com)). Send the generated one-time password via the Fastly-OTP header when creating a token, as shown below.

```plaintext
POST https://api.fastly.com/tokens
Fastly-OTP: 123456
username=youremail@example.com&password=PASSWORD
```

### Availability

Currently, all endpoints that support API keys also support API tokens. In addition to checking if the user is authenticated, the API will check if the user's role ([/guides/user-access-and-control/user-roles-and-how-to-change-them](https://docs-legacy.fastly.com)) is authorized to perform the requested action. For example, billing endpoints will require an API token issued for a billing user (or superuser).

### Scopes

Scopes can be used to limit a token's access. The following scopes are currently supported:

- **api-key**: This is the default scope. Grants the same access level as conventional Fastly API keys.
- **purge**: Allows purging with surrogate-key and URL. Disallows purging with purge all.
- **purge_all**: Allows purging an entire service.

You can also scope the authorization of tokens to a single service by specifying the `service_id` in a parameter in the POST `/tokens` action.

### Expiration

You can optionally set API tokens to expire at a specified date and time. After a token expires, using it for any request will return an HTTP 401 response. Specify the expiration date by using the `expires_at` parameter in the POST `/tokens` action. Format the date and time in ISO 8601 (https://en.wikipedia.org/wiki/ISO_8601) format (e.g., `2016-07-28T19:24:50+00:00`).

### Backward compatibility

API tokens are compatible with API keys, and can be included in any API calls in the `Fastly-Key` HTTP header. The Fastly API will check the provided key against both API keys as well as API tokens. Fastly API clients can use an API token value instead of an existing API key.

### Limitations

API tokens currently have the following limitations:

- Creating, using, and deleting API tokens is currently only available via the API.
- Tokens are associated with the user who created them. If a user's account is deleted, the API tokens associated with that user's account are revoked.
- When you generate a new token, you should store it in a safe place and keep it secret. For security reasons, you won't be able to retrieve the token later.
- There is a limit of 100 tokens per user. Deleted and expired tokens don't count against the limit.
- Tokens carry the same permission model (/guides/user-access-and-control/user-roles-and-how-to-change-them) as the user. For example, if you are a billing user, then your token will only allow you to perform the capabilities of the billing role.

### API reference

An API Token is used to identify who the API call is made on behalf of. It can also be used to restrict what an app can do through authorization scope. Users can create multiple tokens to suit their needs.

### Actions

**GET /tokens**

List all tokens belonging to the authenticated user.

**Authentication**

API token (/api/auth#tokens)

**Request Example**

```
GET /tokens
Fastly-Key: d3caf4b4d4d4d4eef
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json

[
  {
    "id": "5Yo3XXnr0pjc20u0ybf2g",
    "user_id": "4y5K5trZocEAQYkesWlK7M",
    "service_id": null,
    "name": "my_token",
    "scope": "api-key",
    "created_at": "2016-06-22T03:19:48+00:00",
    "expires_at": "2016-07-28T19:24:50+00:00",
  }
]
```

**GET /customer/ id /tokens**
List all tokens belonging to a specific customer

Authentication

API token (/api/auth#tokens)

Request Example

```
GET /customer/:id/tokens
Fastly-Key: d3cafb4dde4dbeeef
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

[{
   "id": "5Yo3XXnrOqjc20u0ybrf2g",
   "user_id": "4y5K5trZocEAQYkesWlk7M",
   "service_id": null,
   "name": "my_token",
   "scope": "api-key",
   "created_at": "2016-06-22T03:19:48+00:00",
   "expires_at": "2016-07-28T19:24:50+00:00",
}]
```

GET /tokens/self

Get a single token based on the access_token used in the request.

Authentication

API token (/api/auth#tokens)

Request Example

```
GET /tokens/self
Fastly-Key: d3cafb4dde4dbeeef
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
   "id": "5Yo3XXnrOqjc20u0ybrf2g",
   "user_id": "4y5K5trZocEAQYkesWlk7M",
   "service_id": null,
   "name": "my_token",
   "scope": "api-key",
   "created_at": "2016-06-22T03:19:48+00:00",
   "expires_at": "2016-07-28T19:24:50+00:00"
}
```
POST /tokens

Create an API token. If two-factor authentication is enabled for your account, review the instructions (/api/auth#two-factor-authentication) for including a one-time password in the request.

Authentication

Username and password

Request Example

POST /tokens
Content-Type: application/x-www-form-urlencoded
Accept: application/json

"username=me@example.com&password=secret&service_id=5VqE6MO0y1QFJbgmCK41pY&expires_at=2016-07-28T19:24:50+00:00"

Response Example

HTTP/1.1 200 OK
Content-Type: application/json

{
  "id": "5Yo3XXnrQpjc20u0ybrf2g",
  "access_token": "d3cafb4dde4dbee",
  "user_id": "4y5K5trZocEAQYkesW1k7M",
  "service_id": "5VqE6MO0y1QFJbgmCK41pY",
  "name": "my_token",
  "scope": "api-key",
  "expires_at": "2016-07-28T19:24:50+00:00",
  "created_at": "2016-06-22T03:19:48+00:00"
}

DELETE /tokens/self

Revoke a token that is used to authenticate the request.

Authentication

API token (/api/auth#tokens)

Request Example

DELETE /tokens/self
Fastly-Key: d3cafb4dde4dbee
Accept: application/json

Response Example

HTTP/1.1 204 No Content
Content-Type: application/json
Revoke a specific token by its id.

**Authentication**

API token (/api/auth#tokens)

**Request Example**

```
DELETE /tokens/5Yo3XXnrQpjc20u0ybrf2g
Fastly-Key: d3cafb4de4d6eeef
Accept: application/json
```

**Response Example**

```
HTTP/1.1 204 No Content
Content-Type: application/json
```

**Troubleshooting**

If the Fastly API returns an error message while you’re working with API tokens, use the following information to troubleshoot the issue.

**POST /tokens**

A response with a JSON body containing an error code is returned on error.

<table>
<thead>
<tr>
<th>HTTP response code</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400</td>
<td>invalid_grant</td>
<td>Supplied username/password combination is not correct.</td>
</tr>
<tr>
<td>400</td>
<td>invalid_request</td>
<td>The username/password combination is not supplied. If you’re using cURL on</td>
</tr>
<tr>
<td></td>
<td></td>
<td>the command line, make sure the options are correct.</td>
</tr>
<tr>
<td>400</td>
<td>invalid_scope</td>
<td>Supplied scope is not valid.</td>
</tr>
<tr>
<td>400</td>
<td>account_locked</td>
<td>Your account is locked.</td>
</tr>
<tr>
<td>400</td>
<td>2fa.verify</td>
<td>Your 2FA token is not supplied or is expired.</td>
</tr>
<tr>
<td>422</td>
<td>Unprocessable</td>
<td>The format of the date and time supplied to the <code>expires_at</code> parameter</td>
</tr>
<tr>
<td></td>
<td>Entity</td>
<td>is invalid.</td>
</tr>
</tbody>
</table>

**GET /tokens**

- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.

**GET /tokens/self**

- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.
DELETE /tokens/:token_id
- An HTTP 400 response is returned on revocation error.
- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.
- An HTTP 404 response is returned on failed token lookup.

DELETE /tokens/self
- An HTTP 400 response is returned on revocation error.
- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.

API key
Your account has a master API key which is scoped to the entire account. You can find the API key on the Account page (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-displaying-your-api-key) in the web interface. Include your API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-displaying-your-api-key) as a `Fastly-Key` header. For example:

```
GET /some/path
Host: https://api.fastly.com
Fastly-Key: d3cafb4dde4dbeef
```

As a simplified cURL example, it would look like this:

```
curl -H "Fastly-Key: d3cafb4dde4dbeef" https://api.fastly.com/some/path
```

Session

⚠️ IMPORTANT: This method will not work if you have Two Factor Authentication (/guides/account-management-and-security/enabling-and-disabling-two-factor-authentication) enabled on your account. You will need to use your full API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-displaying-your-api-key) for authentication.

Some API endpoints allow for `session` authentication. This is similar to how your web browser sends information back and forth to the Fastly web interface (https://manage.fastly.com/).

To gain a session token, first POST your user and password the `/login` endpoint with the parameters `user` and `password`. For example:

```
POST /login
Host: https://api.fastly.com
Content-Type: application/x-www-form-urlencoded

user=testowner@example.com&password=superSecretPassword
```
As a simplified cURL example:

```
curl -d "user=testowner@example.com\npassword=superSecretPassword" https://api.fastly.com/login
```

**NOTE:** The `-d` argument will cause cURL to make the request a POST action with the supplied value as a standard application/x-www-form-urlencoded encoded payload. Depending on your framework, you may have to explicitly set the request to POST and set the Content-Type header.

This request will return a session id in the `fastly.session` value in the form of a standard cookie format (https://en.wikipedia.org/wiki/HTTP_cookie) header.

Most utilities and frameworks include some facility for storing returned cookies, and for sending them with later requests.

Config (/api/config)

ACL

An ACL is a named access control list for matching against a client's IP address during VCL processing. A new ACL is empty and is attached to a working version of a service (not locked or active). The version associated with the ACL must be activated to be used. To remove an ACL from use, the ACL must be deleted from a working version (not locked or active), and that version without the ACL must be activated.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>-</td>
<td>Name for the ACL. Must start with alphanumeric and contain only alphanumeric, underscore, and whitespace.</td>
</tr>

Backend

A backend is an address (IP or domain) from which Fastly pulls content. There can be multiple backends for a service.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address</td>
<td>string</td>
<td>An hostname, IPv4, or IPv6 address for the backend.</td>
</tr>
<tr>
<td>auto_loadbalance</td>
<td>boolean</td>
<td>Whether or not this backend should be automatically load balanced.</td>
</tr>
<tr>
<td>between_bytes_timeout</td>
<td>integer</td>
<td>How long to wait between bytes in milliseconds.</td>
</tr>
<tr>
<td>client_cert</td>
<td>string</td>
<td>Unused.</td>
</tr>
<tr>
<td>comment</td>
<td>string</td>
<td>A comment.</td>
</tr>
<tr>
<td>connect_timeout</td>
<td>integer</td>
<td>How long to wait for a timeout in milliseconds.</td>
</tr>
<tr>
<td>error_threshold</td>
<td>integer</td>
<td>Number of errors to allow before the backend is marked as down.</td>
</tr>
<tr>
<td>first_byte_timeout</td>
<td>integer</td>
<td>How long to wait for the first bytes in milliseconds.</td>
</tr>
<tr>
<td>healthcheck</td>
<td>string</td>
<td>The name of the healthcheck to use with this backend. Can be empty.</td>
</tr>
<tr>
<td>hostname</td>
<td>string</td>
<td>The hostname of the backend.</td>
</tr>
<tr>
<td>ipv4</td>
<td>string</td>
<td>IPv4 address of the host.</td>
</tr>
<tr>
<td>ipv6</td>
<td>string</td>
<td>IPv6 address of the host.</td>
</tr>
<tr>
<td>locked</td>
<td>boolean</td>
<td>Specifies whether or not the version is locked for editing.</td>
</tr>
<tr>
<td>max_conn</td>
<td>integer</td>
<td>Maximum number of connections.</td>
</tr>
<tr>
<td>field</td>
<td>type</td>
<td>description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>max_tls_version</td>
<td>integer</td>
<td>Maximum allowed TLS version on SSL connections to this backend.</td>
</tr>
<tr>
<td>min_tls_version</td>
<td>integer</td>
<td>Minimum allowed TLS version on SSL connections to this backend.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>The name of the backend.</td>
</tr>
<tr>
<td>port</td>
<td>integer</td>
<td>The port number.</td>
</tr>
<tr>
<td>request_condition</td>
<td>string</td>
<td>Condition, which if met, will select this backend during a request.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>shield</td>
<td>string</td>
<td>The shield POP designated to reduce inbound load on this origin by serving the cached data to the rest of the network.</td>
</tr>
<tr>
<td>ssl_ca_cert</td>
<td>string</td>
<td>CA certificate attached to origin.</td>
</tr>
<tr>
<td>ssl_cert_hostname</td>
<td>string</td>
<td>Overrides ssl_hostname, but only for cert verification. Does not affect SNI at all.</td>
</tr>
<tr>
<td>ssl_check_cert</td>
<td>boolean</td>
<td>Be strict on checking SSL certs.</td>
</tr>
<tr>
<td>ssl_ciphers</td>
<td>string</td>
<td>List of OpenSSL ciphers (see <a href="https://www.openssl.org/docs/manmaster/apps/ciphers.html">https://www.openssl.org/docs/manmaster/apps/ciphers.html</a> for details)</td>
</tr>
<tr>
<td>ssl_client_cert</td>
<td>string</td>
<td>Client certificate attached to origin.</td>
</tr>
<tr>
<td>ssl_client_key</td>
<td>string</td>
<td>Client key attached to origin.</td>
</tr>
<tr>
<td>ssl_hostname</td>
<td>string</td>
<td>Used for both SNI during the TLS handshake and to validate the cert.</td>
</tr>
<tr>
<td>ssl_sni_hostname</td>
<td>string</td>
<td>Overrides ssl_hostname, but only for SNI in the handshake. Does not affect cert validation at all.</td>
</tr>
<tr>
<td>use_ssl</td>
<td>boolean</td>
<td>Whether or not to use SSL to reach the backend.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version number of a service.</td>
</tr>
<tr>
<td>weight</td>
<td>integer</td>
<td>Weight used to load balance this backend against others.</td>
</tr>
</tbody>
</table>

<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>string</td>
<td>Allows for termination of execution and either cache, pass, or restart.</td>

<td>cache_condition</td>
<td>string</td>
<td>Name of the condition used to test whether this settings object should be used.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name for the cache settings object.</td>
</tr>
<tr>
<td>stale_ttl</td>
<td>integer</td>
<td>Sets the max &quot;Time To Live&quot; for stale (unreachable) objects.</td>
</tr>
<tr>
<td>ttl</td>
<td>integer</td>
<td>Sets the &quot;Time To Live&quot;.</td>
</tr>
</tbody>
</table>

Actions

Conditions are used to control when and how other objects are used in a service configuration. They contain a statement that evaluates to either true or false and is used to determine whether the condition is met.

Depending on the type of the condition, the statement field can make reference to the Varnish Variables `req`, `resp`, and/or `beresp`.

### Fields

<td>Priority assigned to condition. Order executes from 1 to 10, with 1 being first and 10 being last.</td>
</tr>
<tr>
<td>priority</td>
<td>integer</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>statement</td>
<td>string</td>
<td>The statement used to determine if the condition is met.</td>
</tr>
<tr>
<td>type</td>
<td>string</td>
<td>Type of the condition, either &quot;REQUEST&quot; (req), &quot;RESPONSE&quot; (req, resp), or &quot;CACHE&quot; (req, beresp).</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

### Actions

**GET** `/service/ service_id /version/ version /condition`

GETs all conditions for a particular service and version.

**Authentication**

**Request Example**

```
GET /service/SU1%20IsxPaozGVKXdv0eY/version/1/condition
Fastly-Key: d3cafebdde4dbef
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json
```
GET /service/service_id/version/condition/name

Gets the specified condition.

Authentication

Dictionary

A Dictionary is a table that stores key value pairs accessible to VCL functions during VCL processing. A new dictionary is empty and attached to a working version of a service (not locked/active). In order for the dictionary to appear in generated VCL, the version associated with the dictionary must be activated. To remove a dictionary, the dictionary must be deleted on a working version (not locked/active), and that version without the dictionary then must be activated.

# Director

A Director is responsible for balancing requests among a group of Backends. In addition to simply balancing, Directors can be configured to attempt retrying failed requests. Additionally, Directors have a quorum setting which can be used to determine when the Director as a whole is considered "up", in order to prevent "server whack-a-mole" following an outage as servers come back up.

## Fields

</tr>
<tr>
<td>deleted_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the Director was deleted.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name for the Director.</td>
</tr>
<tr>
<td>quorum</td>
<td>integer</td>
<td>The percentage of capacity that needs to be up for a director to be considered up. Integer, 0 to 100 (default: 75)</td>

**Director Backend**

Maps and relates backends as belonging to directors. Backends can belong to any number of directors but directors can only hold one reference to a specific backend.

**Fields**

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>backend_name</td>
<td>string</td>
<td>Name of the backend to map to the specified director.</td>
</tr>
<tr>
<td>created_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the relationship was created.</td>
</tr>
<tr>
<td>deleted_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the relationship was deleted.</td>
</tr>
<tr>
<td>director</td>
<td>string</td>
<td>Name of the director.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>updated_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the relationship was updated.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

**Actions**

**GET** `/service/service_id/version` `/director/director_name` `/backend/backend_name`

Returns the relationship between a Backend and a Director. If the Backend has been associated with the Director, it returns a simple record indicating this. Otherwise, returns a 404.

**Authentication**

API key ([/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-displaying-your-api-key](https://guides.fastly.com/account-management-and-security/finding-and-managing-your-account-info#finding-and-displaying-your-api-key)) or session cookie ([/api/auth#session](https://api.fastly.com/auth)) with at least **Engineer** permissions ([/guides/user-access-and-control/user-roles-and-how-to-change-them](https://guides.fastly.com/user-access-and-control/user-roles-and-how-to-change-them)).

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>director_name</td>
<td>string</td>
<td>The director name.</td>
</tr>
</tbody>
</table>

**Request Example**

```
Content-Type: application/json

{
  "status":"ok"
}
```
POST /service/service_id/version/version/director/director_name/backend/backend_name

Establishes a relationship between a Backend and a Director. The Backend is then considered a member of the Director and can be used to balance traffic onto.

Authentication

API key (/guides/account-management-and-securityfinding-and-managing-your-account-info#finding-and-displaying-your-api-key) or session cookie (/api/auth#session) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>director_name</td>
<td>string</td>
<td>The director name.</td>
</tr>
</tbody>
</table>

Request Example

```
POST /service/SU1Z0isxPaozGVXXdvoeY/version/1/director/test-director/backend/test-backend HTTP/1.1
Fastly-Key: d3cafb4dde4deebeef
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=utf-8

{
  "backend_name": "test-backend",
  "created_at": "2016-05-05T20:24:29+00:00",
  "deleted_at": null,
  "director_name": "test-director",
  "service_id": "SU1Z0isxPaozGVXXdvoeY",
  "updated_at": "2016-05-05T20:24:29+00:00",
  "version": 1
}
```
```
"version": 1
}
```

**DELETE** `/service/ service_id /version/ version /director/ director_name /backend/ backend_name`

Deletes the relationship between a Backend and a Director. The Backend is no longer considered a member of the Director and thus will not have traffic balanced onto it from this Director.

**Authentication**

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-displaying-your-api-key) or session cookie (/api/auth#session) with at least **Engineer** permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>director_name</td>
<td>string</td>
<td>The director name.</td>
</tr>
</tbody>
</table>

**Request Example**

```
DELETE /service/SU1Z0isxPaozGVKXdv0eY/version/1/director/test-director/backend/test-backend HTTP/1.1
Fastly-Key: d3cafb4dde4dbee
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=utf-8

{
  "status": "ok"
}
```

**Domain**

A domain represents the domain name through which visitors will retrieve content. There can be multiple domains for a service.

**Fields**

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>string</td>
<td>A personal freeform descriptive note.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>The name of the domain or domains associated with this service.</td>
</tr>
<tr>
<td>field</td>
<td>type</td>
<td>description</td>
</tr>
<tr>
<td>-----------</td>
<td>--------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

### Actions

**GET /service/** service_id **/version/** version **/domain/check_all**

Checks the status of all domains’ DNS records for a Service Version. Returns an array of 3 items. The first is the details for the domain, the second is the current CNAME of the domain, and the third is a boolean indicating whether or not it has been properly setup to use Fastly.

Authentication

API key (*/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-displaying-your-api-key*) or session cookie (*/api/auth#session*) with at least **Engineer** permissions (*/guides/user-access-and-control/user-roles-and-how-to-change-them*).

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/domain/check_all
Fastly-Key: d3cafb4dde4de4beef
Accept: application/json
```

Response Example

```

    "version": 1,
  ],
  "global.prod.fastly.net.",
  true
]
```

**GET /service/** service_id **/version/** version **/domain/** name **/check**

Checks the status of a specific domain's DNS record for a Service Version. Returns an array in the same format as domain/check_all.

Authentication

API key (*/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-displaying-your-api-key*) or session cookie (*/api/auth#session*) with at least **Engineer** permissions (*/guides/user-access-and-control/user-roles-and-how-to-change-them*).
Request Example

Healthcheck

Healthchecks are used to customize the way Fastly checks on your Backends. If an origin server is marked unhealthy due to health checks, Fastly will stop attempting to send requests to it. If all origin servers are marked unhealthy, Fastly will attempt to serve stale. If no stale object is available, a 503 will be returned to the client.

<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>string</td>
<td>Allows you to terminate request handling and immediately perform an action. When set it can be lookup or pass (ignore the cache completely).</td>
</tr>
<tr>
<td>bypass_busy_wait</td>
<td>boolean</td>
<td>Disable collapsed forwarding, so you don’t wait for other objects to origin.</td>
</tr>
<tr>
<td>default_host</td>
<td>string</td>
<td>Sets the host header.</td>
</tr>
<tr>
<td>force_miss</td>
<td>boolean</td>
<td>Allows you to force a cache miss for the request. Replaces the item in the cache if the content is cacheable.</td>
</tr>
<tr>
<td>force_ssl</td>
<td>boolean</td>
<td>Forces the request use SSL (redirects a non-SSL to SSL).</td>
</tr>
<tr>
<td>geo_headers</td>
<td>boolean</td>
<td>Injects Fastly-Geo-Country, Fastly-Geo-City, and Fastly-Geo-Region into the request headers.</td>
</tr>
<tr>
<td>hash_keys</td>
<td>string</td>
<td>Comma separated list of varnish request object fields that should be in the hash key.</td>
</tr>
<tr>
<td>max_stale_age</td>
<td>integer</td>
<td>How old an object is allowed to be to serve stale-if-error or stale-while-revalidate.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name for the request settings.</td>
</tr>
<tr>
<td>request_condition</td>
<td>string</td>
<td>Name of condition object used to test whether or not these settings should be used.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>timer_support</td>
<td>boolean</td>
<td>Injects the X-Timer info into the request for viewing origin fetch durations.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

<tr>
<td>name</td>
<td>string</td>
<td>Name that identifies the Response Object.</td>
</tr>
<tr>
<td>status</td>
<td>string</td>
<td>The HTTP Status Code, defaults to 200.</td>
</tr>
<tr>
<td>response</td>
<td>string</td>
<td>The HTTP Response, defaults to &quot;Ok&quot;</td>
</tr>
<tr>
<td>request_condition</td>
<td>string</td>
<td>Name of the condition to be checked during the request phase. If the condition passes then this object will be delivered.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>

**Stats**

Stats give you information on the usage and performance of your Service. They can be request by Service and over a particular time span. Stats are broken down per datacenter, giving you information on how your Services are being used across the world. There is now a more flexible, and fully featured Stats API ([/api/stats](https://docs.fastly.com/api/stats)) available

**Fields**
<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>

<td>integer</td>
<td>Summarize a specific Y/M (requires month)</td>
</tr>
<tr>
<td>month</td>
<td>integer</td>
<td>Summarize a specific month (requires year)</td>
</tr>
</tbody>
</table>

Actions

GET /service/service_id/stats/summary

Get the stats from a service for a block of time. This lists all stats by PoP location, starting with AMS. This call requires parameters to select block of time to query. Use either a timestamp range (using start_time and end_time) or a specified month/year combo (using month and year).

Authentication

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-displaying-your-api-key) or session cookie (/api/auth#session).

Request Example

GET /service/SU120isxPaozGVKXdv0eY/stats/summary?year=2013&month=7
Fastly-Key: d3cafb4dde4debeef
Accept: application/json

Response Example

Soft Purging
Soft Purging sets an object's TTL to 0s, forcing revalidation. For best results, Soft Purging should be used in conjunction with stale_while_revalidate and stale_if_error. The main entry point http://api.fastly.com/ for the API is not needed for a single URL Soft Purge.

**Actions**

**PURGE /***

Soft Purge an individual URL.

**Authentication**

Disabled by default. See Authenticating URL purge requests via API (/guides/purging/authenticating-api-purge-requests) to enable.

**Parameters**

<table>
<thead>

Historical Stats (/api/stats)

The Fastly Historical Stats API (i.e., the Stats API) is a RESTful API that allows Fastly customers to query historical caching stats such as number of requests, hit ratio, and number of errors. The Stats API provides an advanced querying interface that allows for fine grained time period, regional, and sampling control. This document provides a basic overview of Stats and documents all available endpoints.

Endpoint

The base endpoint for the Stats API is https://api.fastly.com/stats/ (https://api.fastly.com/stats/). All URLs are relative to that endpoint. All requests must be sent over HTTPS.

Authentication

To authenticate (/api/auth), use a Fastly-Key header containing your API token (/api/auth#tokens), API key (/api/auth#key), or a session cookie (/api/auth#session).

Here’s an example using the command-line tool cURL:

```
curl -H "Fastly-Key: YOUR_API_KEY" https://api.fastly.com/stats/usage
```

Query Options (Time Range, Sampling Rate, and Regions)

There are four query parameters that you can use to specify what information is returned by the stats API. The `from` and `to` parameters control the window over which you want to fetch stats information. The `by` controls the sampling rate (day, hour, or minute). And the `region` parameter allows you to restrict the result set to a particular region.

Param: from and to

The `from` and `to` parameters are exact times that control the window over which to fetch historical statistics. By default you can use UNIX timestamps when specifying these parameters, but many forms of human readable inputs are also available, such as:

- Yesterday
- Two weeks ago
- 2/20/2013
Date parsing is performed using the Chronic ruby library; for the most detailed information on exactly what formats are available please visit the gem's GitHub page (https://github.com/mojombo/chronic).

Let's see some examples:

```
/stats?from=10+days+ago
```

Returns stats for each of your services, by day, for the last ten days

```
/stats?from=10+days+ago
```

Stats from Tuesday 14th May 2013 @ 20:29:37pm UTC to Thursday 16th May 2013 @ 20:29:37pm UTC

```
/stats?from=1%2F1%2F2013&to=2%2F1%2F2013/
```

Daily stats from January 1st, 2013 (1/1/2013) to February 1st, 2013

When the time of day is not specified, the Stats API assumes 12pm. To specify a midnight to midnight range, you would use `from=1%2F1%2F2013%2000:00&to=2%2F1%2F2013%2000:00` (from=1/1/2013 00:00&to=2/1/2013 00:00, before encoding).

The `from` parameter is "inclusive" and the `to` parameter is "exclusive". This means that we will return only rows with recorded times that match the following inequality:

```
from <= recorded < to
```

⚠️ **NOTE:** We store historical stats information using UTC, and not local time zones. This means that we will use the UTC interpretations of your inputs when querying stats information.

**Param:** `by`

The `by` parameter allows you to control the sampling rate used to produce the result set from querying the Stats API. There are three values that can be set:

- **minute** - Stats will be sampled by minute for each recorded minute in the specified window
- **hour** - Sample by hour within the specified window
- **day** - Sample by day within the specified window

If you do not provide a `by` parameter in your query it will default to 'day'. Each sampling rate also specifies default `to` and `from` parameters if you omit them:

Each value for the `by` parameter has associated defaults for the `to` and `from` parameters if they are omitted, here's an overview:
The `/stats` endpoint allows you to query statistics from Fastly services. By default, it returns statistics on a daily basis, starting from one month ago until the current time.

- **/stats**
  - Defaults to: By day, from 1 month ago, to now

- **/stats?by=hour**
  - Defaults to: by hour, from 1 day ago, to now

- **/stats?by=minute**
  - Defaults to: by minute, from 30 minutes ago, to now

It is important to remember the following conversions when performing queries:

- 1 day = 24 hours
- 1 hour = 60 minutes
- 1 day = 60 * 24 = 1,440 minutes

When changing the sampling rate via the `by` parameter you can accidentally ask for very large data sets if you have defined `to` and `from` parameters. We will not process exceedingly large queries. Please refer to the Response Format section below for more details.

**Param: region**

The Stats API also allows you to limit the scope of your query by restricting it to a particular region. This is achieved via the use of the `region` parameter. Currently the following regions are supported:

- **usa** - Restricts the query to statistics reported by continental United States POPs (Points of Presence)
- **europe** - Restricts the query to statistics reported by European POPs
- **anzac** - Restricts the query to Australia / New Zealand / Asia / Pacific POPs

Usage is exceedingly simple, let's look at some examples:

- **/stats**
  - Returns stats for all regions

- **/stats?region=usa**
  - Returns stats for only US POPs

- **/stats?region=europe**
  - Returns stats for European POPs only
The list of regions will always contain the ones listed above but may grow as Fastly expands into new parts of the globe. Because the list is dynamic, please use the following endpoint to get a list of all available regions:

```
GET /stats/regions
```

See the API section below for example output

It is important to note that not all regions are available to all customers at this time. If you need support for a particular region please feel free to contact us via our helpdesk (https://www.fastly.com/support).

**Response Format**

To make it easier to understand how a query is being processed we use a specific JSON response format. Here is an example:

```
/stats?from=1+day+ago
```

```

    "meta": {

Each of the fields denotes the following:

- **status** - Whether or not we were able to successfully execute the query
- **meta** - Meta information about the scope of the query in a human readable format
- **msg** - If the query was not successful this will provide a string that explains why
- **data** - This contains the actual results of the query that we processed

**Availability of Data**

The collection and processing of statistics information from a globally distributed CDN, such as Fastly, is not instantaneous. Thus there will be a notable delay as to when certain sampling range information will be up to date. Here are the general guidelines:

1. Minutely data will be delayed by roughly 10 to 15 minutes from the current time
2. Hourly data will be delayed by the same amount, and the current hour will return a partial result (because the hour has not finished but we are incrementally aggregating data)
3. Daily data works similarly to hourly data and the current day will also represent a partial result

Real-time analytics (/api/analytics)

Fastly provides an HTTPS endpoint to poll for real-time analytics.

Endpoint

The base endpoint for the real-time analytics system is https://rt.fastly.com. All URLs are relative to that endpoint. All requests must be sent over HTTPS.

Authentication

To authenticate (/api/auth), use a Fastly-Key header containing your API token (/api/auth#tokens), API key (/api/auth#key), or a session cookie (/api/auth#session).

Channels

A channel ID is equivalent to a service ID, so each channel will provide real-time analytics for one service. The provided service ID must be owned by the account specified by the API key used for authentication.

There is a special channel ID demo which is used for the analytics on the fastly.com homepage.

URL structure

For regular real-time analytics, this call allows you to get (and potentially wait for) any messages after a given timestamp. A message covers a one second interval:

<endpoint>/v1/channel/<service id>/ts/<timestamp in seconds>

For the first request, the timestamp can be 0. The response will then return a new timestamp field which should be used for the next request.

There is also "History" call for fetching data from the previous 120 seconds up to the latest timestamp for a channel:

<endpoint>/v1/channel/<service id>/ts/h

This can be modified by fetching the last \( N \) entries.
<endpoint>/v1/channel/<service id>/ts/h/limit/<N>

Response structure

The response is a JSON object. The top level object has two keys: `Timestamp` and `Data`. The `Timestamp` value should be extracted and used for the next API call, e.g.:

1. Set `Timestamp` to 0
2. Make API call
3. Set `Timestamp` to `Timestamp` value of returned JSON object
4. Do something with the rest of the data
5. Goto #2

The `Data` value is a JSON array. For regular real-time analytics calls, it will only have one or two items. For the history call, it will have as many items as were requested.

```
{
    "Timestamp" => 1467915558,
    "Data" => [ ... ]
}
```

Each item is a JSON object with two keys: `recorded` is a Unix time stamp (e.g., seconds since Jan 1st, 1970) of when this data was generated on our cache servers, and `datacenter` with another JSON object as a value.

```
"Data" => [
    {
        "recorded" => 1467915558,
        "datacenter" => {...}
    },
    ...
]
```

The keys of the `datacenter` JSON object are the names of each of our POPs (/guides/about-fastly-services/fastly-pop-locations) around the world plus a special key, called `aggregated`, which adds all the values from all the POPs together.
The value of each of the POP keys is another JSON object that has various statistics. For example, here are the statistics for our San Jose POP during that time:

```
"SJC" => {  
  "requests" => 45,
  "resp_header_bytes" => 22018,
  "resp_body_bytes" => 134564,
  "hits" => 200,
  "miss" => 48,
  "synth" => 4,
  "errors" => 5,
  "hits_time" => 200,
  "miss_time" => 1800,
  "miss_histogram" => {  
    "80" => 33,
    "90" => 1,
    "110" => 1,
    "170" => 1,
    "250" => 1,
    "300" => 2,
    "400" => 1,
    "650" => 2,
    "750" => 1,
    "1000" => 1,
    "1100" => 1
  }
}
```

The keys are the same as those mentioned on the Historical Stats (/api/stats) page, but they show some statistics that have occurred since the last request, including the following:

- Number of requests
- Number of bytes transmitted in headers
- Number of bytes transmitted in bodies
- Number of hits
- Number of misses
- Number of synthetic responses
- Number of errors
- Amount of time spent delivering hits
- Amount of time spent delivering misses

The `miss_histogram` object is a JSON object. The keys are time buckets in 10s of milliseconds, and the values are the number of requests to origin. In this example provided above, 33 requests went to origin that took between 80 and 89 milliseconds to fetch.

The `miss_histogram` tops out at 60s. Any origin request that takes more than 60 seconds to return will be in the 60000 bucket.

**Rate limiting**

The real-time analytics API is rate limited internally. However, it is also cached behind Fastly with an expiration time of 1s. Under normal use there should be no reason for customers to hit that rate limit.

**Remote Logging (/api/logging)**

**S3**

Fastly will upload log messages to the S3 bucket, and in the format, specified in the S3 object.

S3 Canary

Fastly will upload log messages to the S3 bucket, and in the format, specified in the S3 Canary object. This is a temporary controller to test a new S3 library and, as such, is part of a limited availability release. For more information, see our product and feature life cycle descriptions (/guides/customer-support/product-and-feature-life-cycles#limited-availability). If you would like to try it, please contact support@fastly.com (mailto:support@fastly.com).

SFTP

Fastly will upload log messages periodically to the server, and in the format, specified in the SFTP object. This feature is part of a limited availability release. For more information, see our product and feature life cycle descriptions (https://docs.fastly.com/guides/customer-support/product-and-feature-life-cycles#limited-availability). If you would like to try it, please contact support@fastly.com.

DELETE /service/ service_id /version/ version /syslog/ name

Delete the Syslog for a particular service and version

Authentication
API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-displaying-your-api-key) or session cookie (/api/auth#session) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Request Example

```
DELETE /service/SU1Z0isxPaozGVKXdv0eY/version/1/syslog/test-syslog
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{ 
  "status":"ok"
}
```

Utilities (/api/tools)

Content

Fastly makes it possible to see which version of a particular URL is cached on each edge server.

Actions

**GET** /content/edge_check

Retrieve headers and MD5 hash of the content for a particular URL from each Fastly edge server

Authentication

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-displaying-your-api-key) or session cookie (/api/auth#session) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>string</td>
<td>Full URL (host and path) to check on all nodes. If protocol is omitted, http will be assumed</td>
</tr>
</tbody>
</table>

Request Example

```
GET /content/edge_check?url=www.example.com/foo/bar
Accept: application/json
```

Response Example
Datacenter

List Fastly datacenters and their locations.

Actions

GET /datacenters

https://docs.fastly.com/api/aio
Get a list of all Fastly datacenters.

**Authentication**

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-displaying-your-api-key) or session cookie (/api/auth#session).

**Request Example**

GET /datacenters

**Response Example**

    "group": "Europe",
    "name": "Amsterdam",
    "shield": "amsterdam-nl"
  }
]
```

**Docs**

Documentation of the endpoints that return the Fastly API Documentation.

**Actions**

**GET /docs**

Gets all documentation associated with the Fastly API.

**Authentication**

none

**Request Example**

GET /docs
