API (/api/)

Authentication (/api/auth)

To use the Fastly API you will need to create a valid API token. This token will be used to authenticate your API requests.

API tokens

API tokens are unique authentication identifiers that you can create for the users and applications authorized to interact with your service. You can restrict the access of tokens to a single service, and you can limit the capabilities of tokens using a scope other than the default global scope. For example the purge_select scope will limit a token to only be able to purge by URL and surrogate keys. Because users can create multiple API tokens, you can rotate tokens without taking services offline, and you can revoke individual tokens without having to update other API integrations.

Managing tokens with the web interface

You can use the Fastly web interface to create, view, and delete API tokens associated with your personal account. Superusers can view and delete any of the API tokens associated with the organization’s Fastly account. See Using API tokens (/guides/account-management-and-security/using-api-tokens) for more information.

Two-factor authentication

API tokens support two-factor authentication (/guides/account-management-and-security/enabling-and-disabling-two-factor-authentication). Send the generated one-time password via the Fastly-OTP header when creating a token, as shown below.

```
POST https://api.fastly.com/tokens
Fastly-OTP: 123456
username=youremail@example.com&password=PASSWORD
```

Availability

All endpoints that support the legacy API keys also support API tokens. In addition to checking if the user is authenticated, the API will check if the user’s role (/guides/user-access-and-control/configuring-user-roles-and-permissions) is authorized to perform the requested action. For example, billing endpoints will require an API token issued by a billing user (or superuser).
Access

You can limit a token's capabilities using scopes, and you can limit a token's authorizations by defining only those services you want it to access.

Scopes

Scopes can be used to limit a token's capabilities. The following scopes are currently supported:

- **global**: This is the default scope covering all supported capabilities. This scope grants the same access level as legacy API keys.
- **purge_select**: Allows purging with surrogate key and URL. Disallows purging with purge all.
- **purge_all**: Allows purging an entire service via purge_all (/api/purge#purge_bee5ed1a0cfdd541e8b9f970a44718546).
- **global:read**: Allows read-only access to account information, configuration, and stats.

To create a token with a single scope, specify the scope name in the body of the POST request. To create a token with multiple scopes, separate the names with a space (e.g., `scope=purge_all purge_select global:read`).

Services

Tokens are granted access to all services in an account by default. However, you can limit a token's access to one or more services. Do this by specifying an array in the POST `/tokens` action (e.g., `services[]=id1&services[]=id2`).

Expiration

You can optionally set API tokens to expire at a specified date and time. After a token expires, using it for any request will return an HTTP 401 response. Specify the expiration date by using the `expires_at` parameter in the POST `/tokens` action. Format the date and time in ISO 8601 format (e.g., `2016-07-28T19:24:50+00:00`).

Using API tokens

To authenticate API requests, a valid Fastly API token should be included in the `Fastly-Key` HTTP header.

Deleting a user with active tokens

To delete a user (/guides/user-access-and-control/adding-and-deleting-user-accounts#deleting-account-users) who has active API tokens associated with their account, you must first revoke the user's API tokens.
Limitations

API tokens currently have the following limitations:

- Tokens are always associated with the user who created them. This cannot be updated.
- When you generate a new token, you should store it in a safe place and keep it secret. For security reasons, you won’t be able to retrieve the token later.
- There is a limit of 100 tokens per user. Deleted and expired tokens don't count against the limit.
- Tokens carry the same permission model (/guides/user-access-and-control/configuring-user-roles-and-permissions) as the user. For example, if you are a billing user, then your token will only allow you to perform the capabilities of the billing role.

Legacy API keys

If you created a Fastly account before May 15th, 2017, you may have used an API key (or multiple API keys) to authenticate API requests. This account-level credential was migrated to a personal API token with a global scope and access to all of your services. Because all tokens need to be owned by a user, this credential was assigned to a newly created, synthetic user with the name **Global API Token**.

Invitations

Invitations allow superusers and engineers to invite users to set up accounts as collaborators under a main customer account. Superusers can invite collaborators and assign them any role or permission level on a per-service basis. Engineers with no per-service limitations on their role can only invite new collaborators but cannot modify their permissions.

Dictionary

https://docs.fastly.com/api/aio
A Dictionary is a table that stores key value pairs accessible to VCL functions during VCL processing. A new dictionary is empty and attached to a working version of a service (not locked/active). In order for the dictionary to appear in generated VCL, the version associated with the dictionary must be activated. To remove a dictionary, the dictionary must be deleted on a working version (not locked/active), and that version without the dictionary then must be activated.

Director

A Director is responsible for balancing requests among a group of Backends. In addition to simply balancing, Directors can be configured to attempt retrying failed requests. Additionally, Directors have a quorum setting which can be used to determine when the Director as a whole is considered "up", in order to prevent "server whack-a-mole" following an outage as servers come back up.

**Healthcheck**

Healthchecks are used to customize the way Fastly checks on your Backends. If an origin server is marked unhealthy due to health checks, Fastly will stop attempting to send requests to it. If all origin servers are marked unhealthy, Fastly will attempt to serve stale. If no stale object is available, a 503 will be returned to the client.

Dynamic Servers (/api/dynamicservers)

Fastly’s Load Balancer allows you to create pools of origin servers that you dynamically manage using Dynamic Servers (/guides/dynamic-servers/) to distribute and direct incoming requests. To set up Dynamic Servers, you attach a pool to a service, then add versionless origin server that are stored separately from your VCL configuration. You can use the Fastly API to programmatically add, remove, and update pools and origin servers.

⚠️ IMPORTANT: This feature is part of a limited availability release. For more information, see our product and feature lifecycle (/guides/fastly-product-lifecycle/#limited-availability) descriptions.
API Reference

Pool

A pool is responsible for balancing requests among a group of servers. In addition to balancing, pools can be configured to attempt retrying failed requests. Pools have a quorum setting that can be used to determine when the pool as a whole is considered up, in order to prevent problems following an outage as servers come back up.

Historical Stats (/api/stats)

The Fastly Historical Stats API (i.e., the Stats API) is a RESTful API that allows Fastly customers to query historical caching stats such as number of requests, hit ratio, and number of errors. The Stats API provides an advanced querying interface that allows for fine grained time period, regional, and sampling control. This document provides a basic overview of Stats and documents all available endpoints.

Endpoint

The base endpoint for the Stats API is https://api.fastly.com/ (https://api.fastly.com/). All URLs are relative to that endpoint. All requests must be sent over HTTPS.

Authentication

To authenticate (/api/auth), use a `Fastly-Key` header containing your API token (/api/auth#tokens).

Here's an example using the command-line tool cURL:

```bash
curl -H "Fastly-Key: YOUR_FASTLY_TOKEN" https://api.fastly.com/stats
```

Query Options (Time Range, Sampling Rate, and Regions)
There are four query parameters that you can use to specify what information is returned by the stats API. The `from` and `to` parameters control the window over which you want to fetch stats information. The `by` parameter controls the sampling rate (day, hour, or minute). And the `region` parameter allows you to restrict the result set to a particular region.

### Param: `from` and `to`

The `from` and `to` parameters are exact times that control the window over which to fetch historical statistics. By default you can use UNIX timestamps when specifying these parameters, but many forms of human readable inputs are also available, such as:

- Yesterday
- Two weeks ago
- 2/20/2013

Date parsing is performed using the Chronic ruby library; for the most detailed information on exactly what formats are available please visit the gem's GitHub page (https://github.com/mojombo/chronic).

Let's see some examples:

```
/stats?from=10+days+ago
```

Returns stats for each of your services, by day, for the last ten days

```
/stats?from=1494793777&to=1494966577
```

Stats from Tuesday 14th May 2017 @ 20:29:37 UTC to Thursday 16th May 2017 @ 20:29:37 UTC

```
/stats?from=1%2F1%2F2017&to=2%2F1%2F2017
```

Daily stats from January 1st, 2017 (1/1/2017) to February 1st, 2017 (2/1/2017)

When the time of day is not specified, the Stats API assumes 12pm. To specify a midnight to midnight range, you would use `from=1%2F1%2F2013%2000:00&to=2%2F1%2F2013%2000:00` (from=1/1/2013 00:00&to=2/1/2013 00:00, before encoding).

The `from` parameter is "inclusive" and the `to` parameter is "exclusive". This means that we will return only rows with recorded times that match the following inequality:

```
from <= recorded < to
```
**NOTE:** We store historical stats information using UTC, and not local time zones. This means that we will use the UTC interpretations of your inputs when querying stats information.

**Param: by**

The `by` parameter allows you to control the sampling rate used to produce the result set from querying the Stats API. There are three values that can be set:

- `minute` - Stats will be sampled by minute for each recorded minute in the specified window
- `hour` - Sample by hour within the specified window
- `day` - Sample by day within the specified window

If you do not provide a `by` parameter in your query it will default to 'day'. Each sampling rate also specifies default `to` and `from` parameters if you omit them:

Each value for the `by` parameter has associated defaults for the `to` and `from` parameters if they are omitted, here's an overview:

<table>
<thead>
<tr>
<th>URL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/stats</td>
<td>Defaults to: By day, from 1 month ago, to now</td>
</tr>
<tr>
<td>/stats?by=hour</td>
<td>Defaults to: by hour, from 1 day ago, to now</td>
</tr>
<tr>
<td>/stats?by=minute</td>
<td>Defaults to: by minute, from 30 minutes ago, to now</td>
</tr>
</tbody>
</table>

It is important to remember the following conversions when performing queries:

- 1 day = 24 hours
- 1 hour = 60 minutes
- 1 day = 60 * 24 = 1,440 minutes

When changing the sampling rate via the `by` parameter you can accidentally ask for very large data sets if you have defined `to` and `from` parameters. We will not process exceedingly large queries. Please refer to the Response Format section below for more details.
The Stats API also allows you to limit the scope of your query by restricting it to a particular region. This is achieved via the use of the `region` parameter. Currently the following regions are supported:

- `usa` - Restricts the query to statistics reported by POPs in the continental United States
- `europe` - Restricts the query to statistics reported by POPs in Europe
- `anzac` - Restricts the query to statistics reported by POPs in Australia and New Zealand
- `asia` - Restricts the query to statistics reported by POPs in Asia
- `latam` - Restricts the query to statistics reported by POPs in Latin America
- `south_africa` - Restricts the query to statistics reported by POPs in southern Africa

Usage is exceedingly simple, let's look at some examples:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>/stats</code></td>
<td>Returns stats for all regions</td>
</tr>
<tr>
<td><code>/stats?region=usa</code></td>
<td>Returns stats for only US POPs</td>
</tr>
<tr>
<td><code>/stats?region=eupe</code></td>
<td>Returns stats for European POPs only</td>
</tr>
</tbody>
</table>

The following endpoint provides a complete list of all available regions:

```
GET /stats/regions
```

See the API section below for example output

**Response Format**

To make it easier to understand how a query is being processed we use a specific JSON response format. Here is an example:

```
/stats?from=1+day+ago
{
```

Each of the fields denotes the following:

- **status** - Whether or not we were able to successfully execute the query
- **meta** - Meta information about the scope of the query in a human readable format
- **msg** - If the query was not successful this will provide a string that explains why
- **data** - This contains the actual results of the query that we processed

**Availability of Data**

The collection and processing of statistics information from a globally distributed CDN, such as Fastly, is not instantaneous. Thus there will be a notable delay as to when certain sampling range information will be up to date. Here are the general guidelines:

1. Minutely data will be delayed by roughly 10 to 15 minutes from the current time
2. Hourly data will be delayed by the same amount, and the current hour will return a partial result (because the hour has not finished but we are incrementally aggregating data)
3. Daily data works similarly to hourly data and the current day will also represent a partial result

GET /stats/usage_by_month

Returns month-to-date usage details for a given month and year. Usage details are aggregated by service and across all Fastly services, and then grouped by region. This endpoint does not use the `from` or `to` fields for selecting the date for which data is requested. Instead, it uses `month` and `year` integer fields. Both fields are optional and default to the current month and year respectively. When set, an optional `billable_units` field will convert bandwidth to GB and divide requests by 10,000.

Authentication

API token (/api/auth#tokens).

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>month</td>
<td>integer</td>
<td>2-digit month.</td>
</tr>
<tr>
<td>year</td>
<td>integer</td>
<td>4-digit year.</td>
</tr>
<tr>
<td>billable_units</td>
<td>string</td>
<td>If 'true', return results as billable units.</td>
</tr>
</tbody>
</table>

Request Example

```plaintext

Real-time analytics (/api/analytics)
Fastly provides an HTTPS endpoint to poll for real-time analytics.

Endpoint
The base endpoint for the real-time analytics system is https://rt.fastly.com (https://rt.fastly.com). All URLs are relative to that endpoint. All requests must be sent over HTTPS.

Authentication
To authenticate (/api/auth), use a `Fastly-Key` header containing your API token (/api/auth#tokens).

Channels
A channel ID is equivalent to a service ID, so each channel will provide real-time analytics for one service. The provided service ID must be owned by the account specified by the API token used for authentication.

There is a special channel ID demo which is used for the analytics on the fastly.com (https://www.fastly.com) homepage.

URL structure
For regular real-time analytics, this call allows you to get (and potentially wait for) any messages after a given timestamp. A message covers a one second interval:

```
<endpoint>/v1/channel/<service id>/ts/<timestamp in seconds>
```

For the first request, the timestamp can be `0`. The response will then return a new timestamp field which should be used for the next request.

There is also "History" call for fetching data from the previous 120 seconds up to the latest timestamp for a channel:

```
<endpoint>/v1/channel/<service id>/ts/h
```

This can be modified by fetching the last `N` entries.

```
<endpoint>/v1/channel/<service id>/ts/h/limit/<N>
```
The response is a JSON object. The top level object has two keys: Timestamp and Data. The Timestamp value should be extracted and used for the next API call, e.g.:

1. Set Timestamp to 0
2. Make API call
3. Set Timestamp to Timestamp value of returned JSON object
4. Do something with the rest of the data
5. Goto #2

The Data value is a JSON array. For regular real-time analytics calls, it will only have one or two items. For the history call, it will have as many items as were requested.

```
{  
   "Timestamp" => 1467915558,  
   "Data" => [ ... ] 
}
```

Each item is a JSON object with two keys: recorded is a Unix time stamp (e.g., seconds since Jan 1st, 1970) of when this data was generated on our cache servers, and datacenter with another JSON object as a value.

```
"Data" => [  
   {  
      "recorded" => 1467915558,  
      "datacenter" => {...}  
   },  
   ...  
]
```

The keys of the datacenter JSON object are the names of each of our POPs (/guides/basic-concepts/fastly-pop-locations) around the world plus a special key, called aggregated, which adds all the values from all the POPs together.
The value of each of the POP keys is another JSON object that has various statistics. For example, here are the statistics for our San Jose POP during that time:

```
"SJC" => {
  "requests" => 45,
  "resp_header_bytes" => 22018,
  "resp_body_bytes" => 134564,
  "hits" => 200,
  "miss" => 48,
  "synth" => 4,
  "errors" => 5,
  "hits_time" => 200,
  "miss_time" => 1800,
  "miss_histogram" => {
    "80" => 33,
    "90" => 1,
    "110" => 1,
    "170" => 1,
    "250" => 1,
    "300" => 2,
    "400" => 1,
    "650" => 2,
    "750" => 1,
    "1000" => 1,
    "1100" => 1
  }
}
```

The keys are the same as those mentioned on the Historical Stats (/api/stats) page, but they show some statistics that have occurred since the last request, including the following:

- Number of requests
- Number of bytes transmitted in headers
- Number of bytes transmitted in bodies
- Number of hits
- Number of misses
- Number of synthetic responses
- Number of errors
- Amount of time spent delivering hits
- Amount of time spent delivering misses

The `miss_histogram` object is a JSON object. The keys are time buckets in 10s of milliseconds, and the values are the number of requests to origin. In this example provided above, 33 requests went to origin that took between 80 and 89 milliseconds to fetch.

The `miss_histogram` tops out at 60s. Any origin request that takes more than 60 seconds to return will be in the 60000 bucket.

**Rate limiting**

The real-time analytics API is rate limited internally. However, it is also cached behind Fastly with an expiration time of 1s. Under normal use there should be no reason for customers to hit that rate limit.

**Remote Logging (/api/logging)**

**S3**

Fastly will upload log messages to the S3 bucket, and in the format, specified in the S3 object.

Syslog legacy paths

Our original syslog logging endpoints did not include /logging/ as part of the URL pattern. In 2017 we updated the URLs to match the URL pattern of our newer logging endpoints. We maintain the deprecated patterns (without /logging/) as a courtesy.

Fastly offers a web application firewall (WAF) (/guides/web-application-firewall/) security service that allows you to detect malicious request traffic and log or log and block that traffic before it reaches your web application. The Fastly WAF provides rules that detect and block potential attacks. The rules are collected into a policy and deployed within your Fastly service at the edge.

⚠️ IMPORTANT: This feature is part of a limited availability release. For more information, see our product and feature lifecycle (/guides/fastly-product-lifecycle/#limited-availability) descriptions.
