API (/api/)

Authentication (/api/auth)
To use the Fastly API you will need to create a valid API token. This token will be used to authenticate your API requests.

API tokens
API tokens are unique authentication identifiers that you can create for the users and applications authorized to interact with your account and services. You can limit the capabilities of tokens using a scope. For example, the `purge_select` scope will limit a token to only be able to purge by URL and surrogate keys. The default `global` scope will grant the token access to all the service and account-level capabilities of the user that created the token. You can optionally restrict the service-level access of a token to one or more services. However, for a token with the `global` or `global:read` scope, limiting service access does not limit access to non-service related endpoints. Because users can create multiple API tokens, you can rotate tokens without taking services offline, and you can revoke individual tokens without having to update other API integrations.

Managing tokens with the web interface
You can use the Fastly web interface to create, view, and delete API tokens associated with your personal account. Superusers can view and delete any of the API tokens associated with the organization’s Fastly account. See Using API tokens for more information.

Two-factor authentication
API tokens support two-factor authentication. Send the generated one-time password via the Fastly-OTP header when creating a token, as shown below.

```
1 POST https://api.fastly.com/tokens
2 Fastly-OTP: 123456
3 username=youremail@example.com&password=PASSWORD
```

Availability
All endpoints that support the legacy API keys also support API tokens. In addition to checking if the user is authenticated, the API will check if the user's role is authorized to perform the requested action. For example, billing endpoints will require an API token issued by a billing user (or superuser).

Access
You can limit a token's capabilities using scopes, and you can limit a token's authorizations by defining only those services you want it to access. Limiting a token's service access does not prevent the token from accessing non-service related endpoints.

Scopes
Scopes can be used to limit a token's capabilities. The following scopes are currently supported:

- `global`: This is the default scope covering all supported capabilities. This scope grants the same access level as legacy API keys.
- `purge_select`: Allows purging with surrogate key and URL. Disallows purging with purge all.
- `purge_all`: Allows purging an entire service via `purge_all` endpoint.
- `global:read`: Allows read-only access to account information, configuration, and stats.
A Fastly API token allows read-only access to account information, configuration, and stats.

To create a token with a single scope, specify the scope name in the body of the POST request. To create a token with multiple scopes, separate the names with a space (e.g., `scope=purge_all purge_select global:read`).

**Services**

Tokens are granted access to all services in an account by default. However, you can optionally restrict the service-level access of a token to one or more services. Do this by specifying an array in the POST `/tokens` action (e.g., `services[]=id1&services[]=id2`).

Note that limiting service access is designed to be used with the `purge-all` and `purge-select` scopes. A service-limited token with the `global` or `global:read` scopes will still be able to access non-service related endpoints. All service-limited tokens are prevented from modifying service authorizations, inviting new users to the account, and creating and modifying users.

**Expiration**

You can optionally set API tokens to expire at a specified date and time. After a token expires, using it for any request will return an HTTP 401 response. Specify the expiration date by using the `expires_at` parameter in the POST `/tokens` action. Format the date and time in ISO 8601 format (e.g., 2016-07-28T19:24:50+00:00).

**Using API tokens**

To authenticate API requests, a valid Fastly API token should be included in the `Fastly-Key` HTTP header.

**Deleting a user with active tokens**

To delete a user who has active API tokens associated with their account, you must first revoke the user's API tokens.

**Limitations**

API tokens currently have the following limitations:

- Tokens are always associated with the user who created them. This cannot be updated.
- When you generate a new token, you should store it in a safe place and keep it secret. For security reasons, you won’t be able to retrieve the token later.
- There is a limit of 100 tokens per user. Deleted and expired tokens don’t count against the limit.
- Tokens carry the same permission model as the user. For example, if you are a billing user, then your token will only allow you to perform the capabilities of the billing role.

- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.

**Legacy API keys**
If you created a Fastly account before May 15th, 2017, you may have used an API key (or multiple API keys) to authenticate API requests. This account-level credential was migrated to a personal API token with a global scope and access to all of your services. Because all tokens need to be owned by a user, this credential was assigned to a newly created, synthetic user with the name **Global API Token**.

GET /billing/v2/account_customers/:customer_id/mtd_invoice

Get the current month-to-date estimate.

This endpoint has two different responses. Under normal circumstances, it generally takes less than 5 seconds to generate but in certain cases can take up to 60 seconds. Once generated the month-to-date estimate is cached for 4 hours, and is available the next request will return the JSON representation of the month-to-date estimate.

While a report is being generated in the background, this endpoint will return a 202 Accepted response. The full format of which can be found in detail in our billing calculation guide (/guides/account-types-and-billing/how-we-calculate-your-bill).

There are certain accounts for which we are unable to generate a month-to-date estimate. For example, accounts who have parent-pay are unable to generate an MTD estimate. The parent accounts are able to generate a month-to-date estimate but that estimate will not include the child accounts amounts at this time.

Authentication

API token (/api/auth#tokens) of a user with at least billing permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Dictionary

A Dictionary is a table that stores key value pairs accessible to VCL functions during VCL processing. A new dictionary is empty and attached to a working version of a service (not locked/active). In order for the dictionary to appear in generated VCL, the version associated with the dictionary must be activated. To remove a dictionary, the dictionary must be deleted on a working version (not locked/active), and that version without the dictionary then must be activated.

| updated_at| string   | Time-stamp (GMT) when the dictionary was updated.
| version   | integer  | The current version of a service.                |

A Director is responsible for balancing requests among a group of Backends. In addition to simply balancing, Directors can be configured to attempt retrying failed requests. Additionally, Directors have a quorum setting which can be used to determine when the Director as a whole is considered "up", in order to prevent "server whack-a-mole" following an outage as servers come back up.

</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>updated_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the relationship was updated.</td>
</tr>
</tbody>
</table>
### version

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

**Actions**

**GET**  
```
/service/ service_id /version/ version /director/ director_name /backend/ backend_name
```

Returns the relationship between a Backend and a Director. If the Backend has been associated with the Director, it returns a simple record indicating this. Otherwise, returns a 404.

**Authentication**

API token ([/api/auth#tokens](/api/auth#tokens)) of a user with at least **Engineer** permissions ([/guides/user-access-and-control/configuring-user-roles-and-permissions](/guides/user-access-and-control/configuring-user-roles-and-permissions)).

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>director_name</td>
<td>string</td>
<td>The director name.</td>
</tr>
</tbody>
</table>

**Request Example**

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/director/test-director/backend/test-backend  HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK

    "version": 1
}
```

**POST**  
```
/service/ service_id /version/ version /director/ director_name /backend/ backend_name
```

Establishes a relationship between a Backend and a Director. The Backend is then considered a member of the Director and can be used to balance traffic onto.

**Authentication**

API token ([/api/auth#tokens](/api/auth#tokens)) of a user with at least **Engineer** permissions ([/guides/user-access-and-control/configuring-user-roles-and-permissions](/guides/user-access-and-control/configuring-user-roles-and-permissions)).

**Parameters**

<table>
<thead>

Healthcheck

Healthchecks are used to customize the way Fastly checks on your Backends. If an origin server is marked unhealthy due to health checks, Fastly will stop attempting to send requests to it. If all origin servers are marked unhealthy, Fastly will attempt to serve stale. If no stale object is available, a 503 will be returned to the client.

Dynamic Servers [/api/dynamicservers]

Fastly's Load Balancer allows you to create pools of origin servers that you dynamically manage using Dynamic Servers [/guides/dynamic-servers/] to distribute and direct incoming requests. To set up Dynamic Servers, you attach a pool to a service, then add versionless origin server that are stored separately from your VCL configuration. You can use the Fastly API to programmatically add, remove, and update pools and origin servers.

⚠️ IMPORTANT: This feature is part of a limited availability release. For more information, see our product and feature lifecycle [/guides/fastly-product-lifecycle/#limited-availability] descriptions.

API Reference

Pool

A pool is responsible for balancing requests among a group of servers. In addition to balancing, pools can be configured to attempt retrying failed requests. Pools have a quorum setting that can be used to determine when the pool as a whole is considered up, in order to prevent problems following an outage as servers come back up.

## Server

A server is an address (IP address or hostname) to which the Fastly Load Balancer service can forward requests. This service can define multiple servers and assign it to a pool. Fastly can then select any one of these servers based on a selection policy defined for the pool.

Actions

Purge

Soft Purge an individual URL.

Authentication

API token (/api/auth#tokens)
Unspecified by default. See [Authenticating URL purge requests via API](/guides/purging/authenticating-api-purge-requests) to enable.

### Parameters

<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>string</td>
<td>Full path of the URL</td>

{
  "status": "ok",

}
```

**POST /service/service_id/purge/key**

Soft Purge a particular service of items tagged with a key.

**Authentication**

API token ([/api/auth#tokens](/api/auth)) with at least Billing permissions ([/guides/user-access-and-control/configuring-user-roles-and-permissions](/guides/user-access-and-control/configuring-user-roles-and-permissions)).

### Historical Stats (/api/stats)

The Fastly historical Stats API allows you to programmatically retrieve historical caching statistics derived from your Fastly services. You can use these metrics to help you optimize your site’s data caching and analyze your site’s traffic.

**Endpoint**

The base endpoint for the Stats API is [https://api.fastly.com/](https://api.fastly.com/). All URLs are relative to that endpoint. All requests must be sent over HTTPS.

**Authentication**

To authenticate ([/api/auth](/api/auth)), use a `Fastly-Key` header containing your API token ([/api/auth#tokens](/api/auth#tokens)).

Here’s an example using the command-line tool cURL:

```bash
curl -X POST -H "Fastly-Key: YOUR_FASTLY_TOKEN" https://api.fastly.com/service/SU1Z0isxPaozGVKXdv0eY/stats HTTP/1.1
```
Here's an example using the command-line tool cURL:

```bash
1 curl -H "Fastly-Key: YOUR_FASTLY_TOKEN" https://api.fastly.com/stats
```

### Availability of Data

As a general rule, minutely, hourly, and daily data will each be delayed by approximately 10 to 15 minutes from the current time due to the time it takes to collect and process historical data. In addition, the current hour and current day will only return partial results because the data is still being incrementally aggregated for that time period, which isn’t complete.

**IMPORTANT:** You cannot retrieve minutely historical statistics data older than 90 days from the current date. Contact support@fastly.com to discuss your minutely data needs.

### Query Options (Time Range, Sampling Rate, and Regions)

There are four query parameters that you can use to specify what information is returned by the stats API. The `from` and `to` parameters control the window over which you want to fetch stats information. The `by` controls the sampling rate (day, hour, or minute). And the `region` parameter allows you to restrict the result set to a particular region.

**Param: `from` and `to`**

The `from` and `to` parameters are exact times that control the window over which to fetch historical statistics. By default you can use UNIX timestamps when specifying these parameters, but many forms of human readable inputs are also available, such as:

- `Yesterday`
- `Two weeks ago`
- `2/20/2013`

Date parsing is performed using the Chronic ruby library; for the most detailed information on exactly what formats are available please visit the gem's GitHub page ([https://github.com/mojombo/chronic](https://github.com/mojombo/chronic)).

Let’s see some examples:

<table>
<thead>
<tr>
<th>URL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>/stats?from=10+days+ago</code></td>
<td>Returns stats for each of your services, by day, for the last ten days</td>
</tr>
<tr>
<td><code>/stats?from=1494793777&amp;to=1494966577</code></td>
<td>Stats from Tuesday 14th May 2017 @ 20:29:37 UTC to Thursday 16th May 2017 @ 20:29:37 UTC</td>
</tr>
</tbody>
</table>

When the time of day is not specified, the Stats API assumes 12pm. To specify a midnight to midnight range, you would use `from=1%2F1%2F2013%2000:00&to=2%2F1%2F2013%2000:00` (from=1/1/2013 00:00&to=2/1/2013 00:00, before encoding).

The `from` parameter is "inclusive" and the `to` parameter is "exclusive". This means that we will return only rows with recorded times that match the following inequality:

```python
1 from <= recorded < to
```
NOTE: We store historical stats information using UTC, and not local time zones. This means that we will use the UTC interpretations of your inputs when querying stats information.

Param: by

The **by** parameter allows you to control the sampling rate used to produce the result set from querying the Stats API. There are three values that can be set:

- **minute** - Stats will be sampled by minute for each recorded minute in the specified window
- **hour** - Sample by hour within the specified window
- **day** - Sample by day within the specified window

If you do not provide a **by** parameter in your query it will default to ‘day’. Each sampling rate also specifies default **to** and **from** parameters if you omit them:

Each value for the **by** parameter has associated defaults for the **to** and **from** parameters if they are omitted, here’s an overview:

<table>
<thead>
<tr>
<th>Request</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/stats</td>
<td>By day, from 1 month ago, to now</td>
<td></td>
</tr>
<tr>
<td>/stats?by=hour</td>
<td>by hour, from 1 day ago, to now</td>
<td></td>
</tr>
<tr>
<td>/stats?by=minute</td>
<td>by minute, from 30 minutes ago, to now</td>
<td></td>
</tr>
</tbody>
</table>

It is important to remember the following conversions when performing queries:

- 1 day = 24 hours
- 1 hour = 60 minutes
- 1 day = 60 * 24 = 1,440 minutes

When changing the sampling rate via the **by** parameter you can accidentally ask for very large data sets if you have defined **to** and **from** parameters. We will not process exceedingly large queries. Please refer to the Response Format section below for more details.

Param: region

The Stats API also allows you to limit the scope of your query by restricting it to a particular region. This is achieved via the use of the **region** parameter. Currently the following regions are supported:

- **usa** - Restricts the query to statistics reported by POPs in the continental United States
- **europe** - Restricts the query to statistics reported by POPs in Europe
- **anzac** - Restricts the query to statistics reported by POPs in Australia and New Zealand
- **asia** - Restricts the query to statistics reported by POPs in Asia
- **asia_india** - Restricts the query to statistics reported by POPs in India
- **latam** - Restricts the query to statistics reported by POPs in Brazil
- **south_africa** - Restricts the query to statistics reported by POPs in southern Africa
- **southamerica std** - Restricts the query to statistics reported by POPs in South America
Usage is exceedingly simple, let's look at some examples:

```
/stats
```

Returns stats for all regions

```
/stats?region=usa
```

Returns stats for only US POPs

```
/stats?region=eu
```

Returns stats for European POPs only

The following endpoint provides a complete list of all available regions:

```
GET /stats/regions
```

See the API section below for example output

Response Format

To make it easier to understand how a query is being processed we use a specific JSON response format. Here is an example:

```
/stats?from=1+day+ago
```

```
{
   "status": "success",
   "meta": {
      "to": "Thu May 16 20:08:35 UTC 2013",
      "from": "Wed May 15 20:08:35 UTC 2013",
      "by": "day",
      "region": "all"
   },
   "msg": null,
   "data": [ ... ]
}
```

Each of the fields denotes the following:

- **status** - Whether or not we were able to successfully execute the query
- **meta** - Meta information about the scope of the query in a human readable format
- **msg** - If the query was not successful this will provide a string that explains why
- **data** - This contains the actual results of the query that we processed

GET /stats/usage_by_month

Returns month-to-date usage details for a given month and year. Usage details are aggregated by service and across all Fastly services, and then grouped by region.

This endpoint does not use the `from` or `to` fields for selecting the date for which data is requested. Instead, it uses `month` and `year` integer fields. Both fields are optional and default to the current month and year respectively. When set, an optional `billable_units` field will convert bandwidth to GB and divide requests by 10,000.

**Authentication**

API token (/api/auth#tokens).

**Parameters**

<table>

<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>month</td>
<td>integer</td>
<td>2-digit month.</td>
</tr>
<tr>
<td>year</td>
<td>integer</td>
<td>4-digit year.</td>
</tr>
<tr>
<td>billable_units</td>
<td>string</td>
<td>If ‘true’, return results as billable units.</td>
</tr>
</tbody>
</table>

**Request Example**

**Real-time analytics ([/api/analytics](/api/analytics))**

Fastly provides an HTTPS endpoint to poll for real-time analytics.

**Endpoint**

The base endpoint for the real-time analytics system is [https://rt.fastly.com](https://rt.fastly.com). All URLs are relative to that endpoint. All requests must be sent over HTTPS.

**Authentication**

To authenticate ([/api/auth](/api/auth)), use a Fastly-Key header containing your API token ([/api/auth#tokens](/api/auth#tokens)).

**Channels**

A channel ID is equivalent to a service ID, so each channel will provide real-time analytics for one service. The provided service ID must be owned by the account specified by the API token used for authentication.

There is a special channel ID demo which is used for the analytics on the [fastly.com](https://www.fastly.com) homepage.
URL structure

For regular real-time analytics, this call allows you to get (and potentially wait for) any messages after a given timestamp. A message covers a one second interval:

1. `<endpoint>/v1/channel/<service id>/ts/<timestamp in seconds>`

For the first request, the timestamp can be 0. The response will then return a new timestamp field which should be used for the next request.

There is also "History" call for fetching data from the previous 120 seconds up to the latest timestamp for a channel:

1. `<endpoint>/v1/channel/<service id>/ts/h`

This can be modified by fetching the last N entries.

1. `<endpoint>/v1/channel/<service id>/ts/h/limit/<N>`

Response structure

The response is a JSON object. The top level object has two keys: `Timestamp` and `Data`. The `Timestamp` value should be extracted and used for the next API call, e.g.:

1. Set `Timestamp` to 0
2. Make API call
3. Set `Timestamp` to Timestamp value of returned JSON object
4. Do something with the rest of the data
5. Goto #2

The `Data` value is a JSON array. For regular real-time analytics calls, it will only have one or two items. For the history call, it will have as many items as were requested.

```
{  
  "Timestamp": 1467915558,  
  "Data": [ ... ]  
}
```

Each item is a JSON object with two keys: `recorded` is a Unix time stamp (e.g., seconds since Jan 1st, 1970) of when this data was generated on our cache servers, and `datacenter` with another JSON object as a value.

```
{  
  "Data": [  
    {  
      "recorded": 1467915558,  
      "datacenter": { ... }  
    },  
    ...  
  ]  
}
```

The keys of the `datacenter` JSON object are the names of each of our POPs ([guides/basic-concepts/fastly-pop-locations]) around the world plus a special key, called `aggregated`, which adds all the values from all the POPs together.

```
{  
  "Data": [  
    {  
      "datacenter": {  
        "AMS": { ... },  
        "SIN": { ... },  
        "SJC": { ... },  
        ...  
      },  
      "aggregated": { },  
      "recorded": 1478140705  
    },  
    ...  
  ]  
}
```
The value of each of the POP keys is another JSON object that has various statistics. For example, here are the statistics for our San Jose POP during that time:

```json
"SJC" => {
  "requests" => 45,
  "resp_header_bytes" => 22018,
  "resp_body_bytes" => 134564,
  "hits" => 200,
  "miss" => 48,
  "synth" => 4,
  "errors" => 5,
  "hits_time" => 200,
  "miss_time" => 1800,
  "miss_histogram" => {
    "80" => 33,
    "90" => 1,
    "110" => 1,
    "170" => 1,
    "250" => 1,
    "300" => 2,
    "400" => 1,
    "650" => 2,
    "750" => 1,
    "1000" => 1,
    "1100" => 1
  }
}
```

The keys are the same as those mentioned on the Historical Stats (/api/stats) page, but they show some statistics that have occurred since the last request, including the following:

- Number of requests
- Number of bytes transmitted in headers
- Number of bytes transmitted in bodies
- Number of hits
- Number of misses
- Number of synthetic responses
- Number of errors
- Amount of time spent delivering hits
- Amount of time spent delivering misses

The `miss_histogram` object is a JSON object. The keys are time buckets in 10s of milliseconds, and the values are the number of requests to origin. In this example provided above, 33 requests went to origin that took between 80 and 89 milliseconds to fetch.

The `miss_histogram` tops out at 60s. Any origin request that takes more than 60 seconds to return will be in the 60000 bucket.

**Rate limiting**

The real-time analytics API is rate limited internally. However, it is also cached behind Fastly with an expiration time of 1s. Under normal use there should be no reason for customers to hit that rate limit.

**Remote Logging (/api/logging)**

S3
Fastly will upload log messages to the S3 bucket in the format specified in the S3 object.

Syslog legacy paths

Our original syslog logging endpoints did not include /logging/ as part of the URL pattern. In 2017 we updated the URLs to match the URL pattern of our newer logging endpoints. We maintain the deprecated patterns (without /logging/) as a courtesy.

Utilities (/api/tools)

Fastly offers a web application firewall (WAF) security service that allows you to detect malicious request traffic and log or log and block that traffic before it reaches your web application. The Fastly WAF provides rules that detect and block potential attacks. The rules are collected into a policy and deployed within your Fastly service at the edge.
