API (/api/)

Authentication (/api/auth)
To use the Fastly API you will need to create a valid API token. This token will be used to authenticate your API requests.

API tokens
API tokens are unique authentication identifiers that you can create for the users and applications authorized to interact with your account and services. You can limit the capabilities of tokens using a scope. For example, the `purge_select` scope will limit a token to only be able to purge by URL and surrogate keys. The default `global` scope will grant the token access to all the service and account-level capabilities of the user that created the token. You can optionally restrict the service-level access of a token to one or more services. However, for a token with the `global` or `global:read` scope, limiting service access does not limit access to non-service related endpoints. Because users can create multiple API tokens, you can rotate tokens without taking services offline, and you can revoke individual tokens without having to update other API integrations.

Managing tokens with the web interface
You can use the Fastly web interface to create, view, and delete API tokens associated with your personal account. Superusers can view and delete any of the API tokens associated with the organization's Fastly account. See Using API tokens (/guides/account-management-and-security/using-api-tokens) for more information.

Two-factor authentication
API tokens support two-factor authentication (/guides/account-management-and-security/enabling-and-disabling-two-factor-authentication). Send the generated one-time password via the Fastly-OTP header when creating a token, as shown below.
Availability

All endpoints that support the legacy API keys also support API tokens. In addition to checking if the user is authenticated, the API will check if the user's role (/guides/user-access-and-control/configuring-user-roles-and-permissions) is authorized to perform the requested action. For example, billing endpoints will require an API token issued by a billing user (or superuser).

Access

You can limit a token's capabilities using scopes, and you can limit a token's authorizations by defining only those services you want it to access. Limiting a token's service access does not prevent the token from accessing non-service related endpoints.

Scopes

Scopes can be used to limit a token's capabilities. The following scopes are currently supported:

- **global**: This is the default scope covering all supported capabilities. This scope grants the same access level as legacy API keys.
- **purge_select**: Allows purging with surrogate key and URL. Disallows purging with purge all.
- **purge_all**: Allows purging an entire service via purge_all (/api/purge#purge_bee5ed1a0cfd541e8b9f970a44718546).
- **global:read**: Allows read-only access to account information, configuration, and stats.

To create a token with a single scope, specify the scope name in the body of the POST request. To create a token with multiple scopes, separate the names with a space (e.g., `scope=purge_all purge_select global:read`).

Services

Tokens are granted access to all services in an account by default. However, you can optionally restrict the service-level access of a token to one or more services. Do this by specifying an array in the POST /tokens action (e.g., `services[]=id1&services[]=id2`).
Note that limiting service access is designed to be used with the `purge-all` and `purge-select` scopes. A service-limited token with the `global` or `global:read` scopes will still be able to access non-service related endpoints. All service-limited tokens are prevented from modifying service authorizations, inviting new users to the account, and creating and modifying users.

**Expiration**

You can optionally set API tokens to expire at a specified date and time. After a token expires, using it for any request will return an HTTP 401 response. Specify the expiration date by using the `expires_at` parameter in the POST `/tokens` action. Format the date and time in ISO 8601 (https://en.wikipedia.org/wiki/ISO_8601) format (e.g., 2016-07-28T19:24:50+00:00).

**Using API tokens**

To authenticate API requests, a valid Fastly API token should be included in the `Fastly-Key` HTTP header.

**Deleting a user with active tokens**

To delete a user (/guides/user-access-and-control/adding-and-deleting-user-accounts#deleting-account-users) who has active API tokens associated with their account, you must first revoke the user’s API tokens.

**Limitations**

API tokens currently have the following limitations:

- Tokens are always associated with the user who created them. This cannot be updated.
- When you generate a new token, you should store it in a safe place and keep it secret. For security reasons, you won’t be able to retrieve the token later.
- There is a limit of 100 tokens per user. Deleted and expired tokens don’t count against the limit.
- Tokens carry the same permission model (/guides/user-access-and-control/configuring-user-roles-and-permissions) as the user. For example, if you are a billing user, then your token will only allow you to perform the capabilities of the billing role.

## Actions

**GET /tokens**

List all tokens belonging to the authenticated user.

**Authentication**
API token (/api/auth#tokens) with at least Billing permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

```
GET /tokens HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

▼ Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

]
```

GET /customer/:id/tokens

List all tokens belonging to a specific customer

Authentication

API token (/api/auth#tokens) with at least Billing permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

```
GET /customer/:id/tokens HTTP/1.1

]
```

**GET /tokens/self**

Get a single token based on the access_token used in the request.

**Authentication**

API token (/api/auth#tokens).

**Request Example**

```
GET /tokens/self HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json
```
Create an API token. If two-factor authentication is enabled for your account, review the instructions (/api/auth#two-factor-authentication) for including a one-time password in the request.

Authentication

Username and password.

Request Example

```plaintext
POST /tokens HTTP/1.1
Content-Type: application/x-www-form-urlencoded
Accept: application/json

$username=me@example.com&password=secret&services[]=5VqE6MOOy1QFJbgmCK41pY&services[]=6VqE6MOOy1QFJbgmCK41pZ&expires_at=2016-07-28T19:24:50Z"
```

Response Example

```plaintext
HTTP/1.1 200 OK
Content-Type: application/json
```
Revoke a token that is used to authenticate the request.

Authentication

API token (/api/auth#tokens).

Request Example

```plaintext
DELETE /tokens/self HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

Response Example

```plaintext
HTTP/1.1 204 No Content
Content-Type: application/json
```

Revoke a specific token by its id.

Authentication

API token (/api/auth#tokens) with at least Billing permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example
Revoke Tokens in bulk format. Users may only revoke their own tokens. Superusers may revoke tokens of others.

**Authentication**

**API token** [/api/auth#tokens).

**Request Example**

```
DELETE /tokens HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/vnd.api+json; ext=bulk
Content-Type: application/vnd.api+json; ext=bulk

{
    "data" => [

            "type" => "token",
        }
    ]
}
```

**Response Example**

```
HTTP/1.1 204 No Content
Content-Type: application/vnd.api+json; ext=bulk
```
Troubleshooting

If the Fastly API returns an error message while you're working with API tokens, use the following information to troubleshoot the issue.

POST /tokens

A response with a JSON body containing an error code is returned on error.

<table>
<thead>
<tr>
<th>HTTP response code</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400</td>
<td>invalid_grant</td>
<td>The supplied username/password combination is not correct.</td>
</tr>
<tr>
<td>400</td>
<td>invalid_request</td>
<td>The username/password combination is not supplied. If you're using cURL on the command line, make sure the options are correct.</td>
</tr>
<tr>
<td>400</td>
<td>invalid_scope</td>
<td>The supplied scope is not valid.</td>
</tr>
<tr>
<td>400</td>
<td>account_locked</td>
<td>Your account is locked.</td>
</tr>
<tr>
<td>400</td>
<td>2fa.verify</td>
<td>Your 2FA token is not supplied or is expired.</td>
</tr>
<tr>
<td>422</td>
<td>Unprocessable Entity</td>
<td>The format of the date and time supplied to the expires_at parameter is invalid.</td>
</tr>
</tbody>
</table>

GET /tokens

- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.

GET /tokens/self

- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.

DELETE /tokens/:token_id

- An HTTP 400 response is returned on revocation error.
- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.
- An HTTP 404 response is returned on failed token lookup.

DELETE /tokens/self
- An HTTP 400 response is returned on revocation error.
- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.

Legacy API keys

If you created a Fastly account before May 15th, 2017, you may have used an API key (or multiple API keys) to authenticate API requests. This account-level credential was migrated to a personal API token with a global scope and access to all of your services. Because all tokens need to be owned by a user, this credential was assigned to a newly created, synthetic user with the name Global API Token.

GET /billing/v2/account_customers/ customer_id /mtd_invoice

Get the current month-to-date estimate.

This endpoint has two different responses. Under normal circumstances, it generally takes less then 5 seconds to generate but in certain cases can take up to 60 seconds. Once generated the month-to-date estimate is cached for 4 hours, and is available the next request will return the JSON representation of the month-to-date estimate.

While a report is being generated in the background, this endpoint will return a 202 Accepted response. The full format of which can be found in detail in our billing calculation guide (/guides/account-types-and-billing/how-we-calculate-your-bill).

There are certain accounts for which we are unable to generate a month-to-date estimate. For example, accounts who have parent-pay are unable to generate an MTD estimate. The parent accounts are able to generate a month-to-date estimate but that estimate will not include the child accounts amounts at this time.

Authentication

API token (/api/auth#tokens) of a user with at least Billing permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Invitations

Invitations allow superusers and engineers to invite users to set up accounts as collaborators under a main customer account. Superusers can invite collaborators and assign them any role or permission level on a per-service basis. Engineers with no per-service limitations on their role
can only invite new collaborators but cannot modify their permissions.

Config (/api/config)

ACL

An ACL is a named access control list for matching against a client’s IP address during VCL processing. A new ACL is empty and is attached to a working version of a service (not locked or active). The version associated with the ACL must be activated to be used. To remove an ACL from use, the ACL must be deleted from a working version (not locked or active), and that version without the ACL must be activated.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>string</td>
<td>Name for the ACL. Must start with alphanumeric and contain only alphanumeric, underscore, and whitespace.</td>
</tr>
</tbody>
</table>

Actions

GET /service/ service_id /version/ version /acl

List ACLs

Authentication

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example
GET /service/SU1Z0isxPaozGVKXdv0eY/version/2/acl HTTP/1.1

**Actions**

GET /service/ service_id /version/ version /backend
List all backends for a particular service and version.

Authentication

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/backend HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json
```
GET /service/service_id /version/ version /backend/ name

Get the backend for a particular service and version.

Authentication

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/backend/test-backend HTTP/1.1

Cache Settings

Controls how caching is performed on Fastly. When used in conjunction with Conditions the Cache Settings provide you with fine grain control over how long content persists in the cache.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>string</td>
<td>Allows for termination of execution and either cache, pass, or restart.</td>

<tr>
<td>stale_ttl</td>
<td>integer</td>
<td>Sets the max &quot;Time To Live&quot; for stale (unreachable) objects.</td>
</tr>
<tr>
<td>ttl</td>
<td>integer</td>
<td>Sets the &quot;Time To Live&quot;.</td>
</tr>
</tbody>
</table>

Actions

GET /service/ service_id /version/ version /cache_settings

Get a list of all cache settings for a particular service and version.

Authentication
API token (/api/auth#tokens) of a user with at least **Engineer** permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

```

## Condition

Conditions are used to control when and how other objects are used in a service configuration. They contain a statement that evaluates to either true or false and is used to determine whether the condition is met.

Depending on the type of the condition, the statement field can make reference to the Varnish Variables `req`, `resp`, or `beresp`.

### Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>

<tr>
<td>comment</td>
<td>string</td>
<td>Name of the condition.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name of the condition.</td>
</tr>
<tr>
<td>priority</td>
<td>integer</td>
<td>Priority assigned to condition. Order executes from 1 to 10, with 1 being first and 10 being last.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>statement</td>
<td>string</td>
<td>The statement used to determine if the condition is met.</td>
</tr>
<tr>
<td>type</td>
<td>string</td>
<td>Type of the condition, either &quot;REQUEST&quot; (req), &quot;RESPONSE&quot; (req, resp), &quot;CACHE&quot; (req, beresp), or &quot;PREFETCH&quot; (req, bereq).</td>
</tr>
<tr>
<td>------------</td>
<td>--------</td>
<td>----------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>

**Actions**

**GET**  
/service/ service_id /version/ version /condition

Gets all conditions for a particular service and version.

**Authentication**

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

**Request Example**

Dictionary

A Dictionary is a table that stores key value pairs accessible to VCL functions during VCL processing. A new dictionary is empty and attached to a working version of a service (not locked/active). In order for the dictionary to appear in generated VCL, the version associated with the dictionary must be activated. To remove a dictionary, the dictionary must be deleted on a working version (not locked/active), and that version without the dictionary then must be activated.

Dictionary Info

DictionaryInfo provides metadata for a Dictionary.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>last_updated</td>
<td>string</td>
<td>Time-stamp (GMT) when the dictionary was last updated.</td>
</tr>
<tr>
<td>item_count</td>
<td>integer</td>
<td>The number of items belonging to the dictionary.</td>
</tr>
<tr>
<td>digest</td>
<td>string</td>
<td>Hash of the dictionary content.</td>
</tr>
</tbody>
</table>

Actions

**GET**  /service/ service_id /version/ version /dictionary/ id /info

Retrieve metadata for a single dictionary by ID for a version and service.

Authentication

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

```
GET  /service/SU1%0isxPaozGVKXdv0eY/version/1/dictionary/5clCytcTJrnvPi8wjqPH0q/info
HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json
```
Dictionary Item

A DictionaryItem holds a key and value that make up an entry in a Dictionary. DictionaryItems are versionless so they can be modified without activating a new version.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>created_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the dictionary was created.</td>
</tr>
<tr>
<td>deleted_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the dictionary was deleted.</td>
</tr>
<tr>
<td>dictionary_id</td>
<td>string</td>
<td>The dictionary for this Item.</td>
</tr>
<tr>
<td>item_key</td>
<td>string</td>
<td>Key for the DictionaryItem.</td>
</tr>
<tr>
<td>item_value</td>
<td>string</td>
<td>Value for the DictionaryItem.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The service the Dictionary belongs to.</td>
</tr>
<tr>
<td>updated_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the dictionary was updated.</td>
</tr>
</tbody>
</table>

Actions

GET  /service/ service_id /dictionary/ dictionary_id /items

List of DictionaryItems given service and dictionary ID.

Authentication

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example
GET /service/SU1Z0isxPaozGVKXdv0eY/dictionary/5clCytcTJrnvPi8wjqPH0q/items HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

**Response Example**

```json
HTTP/1.1 200 OK
Content-Type: application/json

[
  {
    "dictionary_id": "5clCytcTJrnvPi8wjqPH0q",

  }
]
```

**GET /service/service_id/dictionary/dictionary_id/item/item_key**

Retrieve a single DictionaryItem given service, dictionary ID and item key.

**Authentication**

API token (/api/auth#tokens) of a user with at least [Engineer permissions](/guides/user-access-and-control/configuring-user-roles-and-permissions).

**Request Example**

```text
GET /service/SU1Z0isxPaozGVKXdv0eY/dictionary/5clCytcTJrnvPi8wjqPH0q/item/some_key HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```json
HTTP/1.1 200 OK
Content-Type: application/json
```
POST /service/ service_id /dictionary/ dictionary_id /item

Create DictionaryItem given service, dictionary ID, item key, and item value.

Authentication

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

```
POST /service/SU1Z0isxPaozGVKXdv0eY/dictionary/5clCytcTJrnvPi8wjgPH0q/item HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/x-www-form-urlencoded
Accept: application/json

item_key=some_key&item_value=some_value
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "dictionary_id": "5clCytcTJrnvPi8wjgPH0q",
  "service_id": "SU1Z0isxPaozGVKXdv0eY",

  "updated_at": "2016-04-21T18:14:32+00:00"
}
```
PUT /service/ service_id/dictionary/ dictionary_id/item/ item_key

Upset DictionaryItem given service, dictionary ID, item key, and item value.

Authentication

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

```
PUT /service/SU1Z0isxPaozGVKXdv0eY/dictionary/5clCytcTJrnvPi8wjgPH0g/item/some_key
HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/x-www-form-urlencoded
Accept: application/json

}
```

PATCH /service/ service_id /dictionary/ dictionary_id /item/ item_key

Update DictionaryItem given service, dictionary ID, item key, and item value.

Authentication

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example
**PATCH** /service/SU1Z0isxPaozGVKXdv0eY/dictionary/5clCytcTJrnvPi8wjqPH0q/item/some_key
HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/x-www-form-urlencoded
Accept: application/json

item_value=new_value

**Response Example**

**HTTP/1.1 200 OK**
Content-Type: application/json

```
{
    "dictionary_id": "5clCytcTJrnvPi8wjqPH0q",
    "service_id": "SU1Z0isxPaozGVKXdv0eY",

    "updated_at": "2016-04-21T18:14:32+00:00"
}
```

**PATCH** /service/ service_id /dictionary/ dictionary_id /items

Update DictionaryItem in batch for given service, dictionary ID and key/value pairs for items.

**Authentication**

*API token (/api/auth#tokens)* of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

**Request Example**

```
PATCH /service/SU1Z0isxPaozGVKXdv0eY/dictionary/5clCytcTJrnvPi8wjqPH0q/items HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/json
Accept: application/json

▼ Response Example

HTTP/1.1 200 OK
Content-Type: application/json

{
  "status": "ok"
}

**DELETE**  /service/ service_id /dictionary/ dictionary_id /item/ item_key

Delete DictionaryItem given service, dictionary ID, and item key.

Authentication

API token (/api/auth#tokens) of a user with at least [Engineer permissions](/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example
DELETE /service/SU1Z0isxPaozGVKXdv0eY/dictionary/5clCytcTJrnvPi8wjqPH0q/item/some_key HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

▼ Response Example

Director

A Director is responsible for balancing requests among a group of Backends. In addition to simply balancing, Directors can be configured to attempt retrying failed requests. Additionally, Directors have a quorum setting which can be used to determine when the Director as a whole is considered "up", in order to prevent "server whack-a-mole" following an outage as servers come back up.
### Fields

Maps and relates backends as belonging to directors. Backends can belong to any number of directors but directors can only hold one reference to a specific backend.

**Fields**

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>backend_name</td>
<td>string</td>
<td>Name of the backend to map to the specified director.</td>
</tr>
<tr>
<td>created_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the relationship was created.</td>
</tr>
<tr>
<td>deleted_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the relationship was deleted.</td>
</tr>
<tr>
<td>director</td>
<td>string</td>
<td>Name of the director.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>updated_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the relationship was updated.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

**Actions**

```
GET /service/ service_id /version/ version /director/ director_name /backend/ backend_name
```

Returns the relationship between a Backend and a Director. If the Backend has been associated with the Director, it returns a simple record indicating this. Otherwise, returns a 404.

**Authentication**

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>director_name</td>
<td>string</td>
<td>The director name.</td>
</tr>
</tbody>
</table>

**Request Example**
Establishes a relationship between a Backend and a Director. The Backend is then considered a member of the Director and can be used to balance traffic onto.

**Authentication**

API token (/api/auth#tokens) of a user with at least **Engineer permissions** (/guides/user-access-and-control/configuring-user-roles-and-permissions).

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>director_name</td>
<td>string</td>
<td>The director name.</td>
</tr>
</tbody>
</table>

**Request Example**

```
POST /service/SU1Z0isxPaozGVKXdv0eY/version/1/director/test-director/backend/test-backend HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=utf-8
```
DELETE /service/service_id/version/version/director/director_name/backend/backend_name

Deletes the relationship between a Backend and a Director. The Backend is no longer considered a member of the Director and thus will not have traffic balanced onto it from this Director.

Authentication

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>director_name</td>
<td>string</td>
<td>The director name.</td>
</tr>
</tbody>
</table>

Request Example

DELETE /service/SU1Z0isxPaozGVKXdv0eY/version/1/director/test-director/backend/test-backend HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

▼ Response Example

HTTP/1.1 200 OK
Content-Type: application/json;charset=utf-8

```json

Domain

A domain represents the domain name through which visitors will retrieve content. There can be multiple domains for a service.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>string</td>
<td>A personal freeform descriptive note.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>The name of the domain or domains associated with this service.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

Actions

GET /service/service_id/version/version/domain/check_all

Checks the status of all domains' DNS records for a Service Version. Returns an array of 3 items. The first is the details for the domain, the second is the current CNAME of the domain, and the third is a boolean indicating whether or not it has been properly setup to use Fastly.

Authentication

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

GET /service/SU1%0isxPaozGVKXdv0eY/version/1/domain/check_all HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json
GET /service/ service_id /version/ version /domain/ name /check

Checks the status of a specific domain's DNS record for a Service Version. Returns an array in the same format as domain/check_all.

Authentication

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

```plaintext
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/domain/www.example.com/check HTTP/1.1

<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

Actions

```
GET /service/ service_id /version/ version /gzip
```

List all gzip configurations for a particular service and version

Authentication
API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

```bash
GET /service/SU1Z0isxPaozGVKXdv0eY/version/2/gzip HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

## Healthcheck

Healthchecks are used to customize the way Fastly checks on your Backends. If an origin server is marked unhealthy due to health checks, Fastly will stop attempting to send requests to it. If all origin servers are marked unhealthy, Fastly will attempt to serve stale. If no stale object is available, a 503 will be returned to the client.

### Fields

<td>bypass_busy_wait</td>
<td>boolean</td>
<td>Disable collapsed forwarding, so you don’t wait for other objects to origin.</td>
</tr>
<tr>
<td>default_host</td>
<td>string</td>
<td>Sets the host header.</td>
</tr>
<tr>
<td>force_miss</td>
<td>boolean</td>
<td>Allows you to force a cache miss for the request. Replaces the item in the cache if the content is cacheable.</td>
</tr>
<tr>
<td>force_ssl</td>
<td>boolean</td>
<td>Forces the request use SSL (redirects a non-SSL to SSL).</td>
</tr>
<tr>
<td>geo_headers</td>
<td>boolean</td>
<td>Injects Fastly-Geo-Country, Fastly-Geo-City, and Fastly-Geo-Region into the request headers.</td>

Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json
```
**GET**  /service/ service_id /version/ version /request_settings/ name

Gets the specified Request Settings object.

**Authentication**

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

**Request Example**

GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/request_settings/testrequest HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

**Response Example**

HTTP/1.1 200 OK
Content-Type: application/json
POST /service/service_id/version/version/request_settings

Creates a new Request Settings object.

Authentication

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

```plaintext
POST /service/SU1Z0isxPaozGVKXdv0eY/version/1/request_settings HTTP/1.1

```

Response Example
DELETE /service/ service_id /version/ version /request_settings/ name

Removes the specified Request Settings object.

**Authentication**

API token ([/api/auth#tokens](/api/auth#tokens)) of a user with at least [Engineer permissions](/guides/user-access-and-control/configuring-user-roles-and-permissions).

**Request Example**

```
DELETE /service/SU1Z0isxPaozGVKXdv0eY/version/1/request_settings/testrequest HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json

{

Stats

Stats give you information on the usage and performance of your Service. They can be requested by Service and over a particular time span. Stats are broken down per datacenter, giving you information on how your Services are being used across the world. There is now a more flexible, and fully featured Stats API (/api/stats) available.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_time</td>
<td>integer</td>
<td>Epoch timestamp for period request</td>
</tr>
<tr>
<td>end_time</td>
<td>integer</td>
<td>Epoch timestamp for period request</td>

<tr>
<td>year</td>
<td>integer</td>
<td>Summarize a specific Y/M (requires month)</td>
</tr>
<tr>
<td>month</td>
<td>integer</td>
<td>Summarize a specific month (requires year)</td>
</tr>
</tbody>
</table>

Actions

GET /service/ service_id /stats/summary
Get the stats from a service for a block of time. This lists all stats by PoP location, starting with AMS. This call requires parameters to select block of time to query. Use either a timestamp range (using start_time and end_time) or a specified month/year combo (using month and year).

Authentication

API token (/api/auth#tokens) with at least Billing permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/stats/summary?year=2013&month=7 HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

Dynamic Servers (/api/dynamicservers)

Fastly’s Load Balancer allows you to create pools of origin servers that you dynamically manage using Dynamic Servers (/guides/dynamic-servers/) to distribute and direct incoming requests. To set up Dynamic Servers, you attach a pool to a service, then add versionless origin server that are stored separately from your VCL configuration. You can use the Fastly API to programmatically add, remove, and update pools and origin servers.

⚠️ IMPORTANT: This feature is part of a limited availability release. For more information, see our product and feature lifecycle (/guides/fastly-product-lifecycle/#limited-availability) descriptions.

API Reference

Pool
A pool is responsible for balancing requests among a group of servers. In addition to balancing, pools can be configured to attempt retrying failed requests. Pools have a quorum setting that can be used to determine when the pool as a whole is considered up, in order to prevent problems following an outage as servers come back up.

### Fields

Server

A server is an address (IP address or hostname) to which the Fastly Load Balancer service can forward requests. This service can define multiple servers and assign it to a pool. Fastly can then select any one of these servers based on a selection policy defined for the pool.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>

<tr>
<td>weight</td>
<td>string</td>
<td>Weight (1-100) used to load balance this server against others. Optional. Defaults to '100' if not set.</td>
</tr>
<tr>
<td>max_conn</td>
<td>string</td>
<td>Maximum number of connections. If the value is '0', it inherits the value from pool's max_conn_default. Optional. Defaults to '0' if not set.</td>

Purge (/api/purge)

Purging

Instant Purging removes content from Fastly immediately so it can be refreshed from your origin servers. The main entry point for the API, https://api.fastly.com/, is not needed for an individual URL Instant Purge.

Actions

- PURGE *

  Instant Purge an individual URL.

Authentication

Disabled by default. See Authenticating URL purge requests via API (/guides/purging/authenticating-api-purge-requests) to enable.

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>string</td>
<td>Full path of the URL.</td>
</tr>
</tbody>
</table>

Request Example

curl -X PURGE https://www.example.com/image.jpg

Response Example

HTTP/1.1 200 OK
Content-Type: application/json

{
  "status": "ok",
  "id": "108-1391560174-974124"
}
POST  /service/ service_id /purge_all

Instant Purge everything from a service.

Authentication

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

```
POST /service/SU1Z0isxPaozGVKXdv0eY/purge_all HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

▼ Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "status": "ok"
}
```

POST  /service/ service_id /purge/ key

Instant Purge a particular service of items tagged with a Surrogate Key. Only one surrogate key can be purged at a time. Multiple keys can be purged using a batch surrogate key purge request.

Authentication

API token (/api/auth#tokens).

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>string</td>
<td>Surrogate Key to purge.</td>
</tr>
</tbody>

POST /service/SU1Z0isxPaozGVKXdv0eY/purge/hTE5dRlsBCGjxJwCH4M HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

▼ Response Example
POST /service/ service_id /purge

Instant Purge a particular service of items tagged with Surrogate Keys in a batch. Up to 256 surrogate keys can be purged in one batch request.

Authentication

API token (/api/auth#tokens).

Request Example

```
POST /service/SU1Z0isxPaozGVXdv0eY/purge HTTP/1.1
Surrogate-Key: key_1 key_2 key_3
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "key_1":"108-1391560174-974124",
    "key_2":"108-1391560174-974125",

So purging

Soft Purging

Soft Purging sets an object’s TTL to 0s, forcing revalidation. For best results, Soft Purging should be used in conjunction with stale_while_revalidate and stale_if_error. The main entry point https://api.fastly.com/ for the API is not needed for a single URL Soft Purge.

**Actions**

**PURGE**  *

Soft Purge an individual URL.

**Authentication**

Disabled by default. See Authenticate URL purge requests via API (/guides/purging/authenticating-api-purge-requests) to enable.

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>string</td>
<td>Full path of the URL</td>
</tr>
</tbody>
</table>

**Request Example**

curl -X PURGE -H "Fastly-Soft-Purge:1" https://www.example.com/image.jpg
POST /service/ service_id /purge/ key

Soft Purge a particular service of items tagged with a key.

Authentication
API token (/api/auth#tokens) with at least Billing permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

```plaintext
POST /service/SU1Z0isxPaozGVKXdv0eY/purge/hTE5dRLSBICGPJxJwCH4M HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
Fastly-Soft-Purge: 1
```

Response Example

```plaintext
HTTP/1.1 200 OK
Content-Type: application/json

{
  "status": "ok",
  "id": "108-1391560174-974124"
}
```

Historical Stats (/api/stats)
The Fastly historical Stats API allows you to programmatically retrieve historical caching statistics derived from your Fastly services. You can use these metrics to help you optimize your site’s data caching and analyze your site’s traffic.

Endpoint
The base endpoint for the Stats API is `https://api.fastly.com/`. All URLs are relative to that endpoint. All requests must be sent over HTTPS.

**Authentication**

To authenticate `/api/auth`, use a `Fastly-Key` header containing your API token `/api/auth#tokens`.

Here’s an example using the command-line tool cURL:

```bash
1 curl -H "Fastly-Key: YOUR_FASTLY_TOKEN" https://api.fastly.com/stats
```

**Availability of Data**

As a general rule, minutely, hourly, and daily data will each be delayed by approximately 10 to 15 minutes from the current time due to the time it takes to collect and process historical data. In addition, the current hour and current day will only return partial results because the data is still being incrementally aggregated for that time period, which isn’t complete.

⚠️ **IMPORTANT:** You cannot retrieve minutely historical statistics data older than 90 days from the current date. Contact support@fastly.com to discuss your minutely data needs.

**Query Options (Time Range, Sampling Rate, and Regions)**

There are four query parameters that you can use to specify what information is returned by the stats API. The `from` and `to` parameters control the window over which you want to fetch stats information. The `by` controls the sampling rate (day, hour, or minute). And the `region` parameter allows you to restrict the result set to a particular region.

**Param:** `from` and `to`

The `from` and `to` parameters are exact times that control the window over which to fetch historical statistics. By default you can use UNIX timestamps when specifying these parameters, but many forms of human readable inputs are also available, such as:

- Yesterday
- Two weeks ago
Date parsing is performed using the Chronic ruby library; for the most detailed information on exactly what formats are available please visit the gem's GitHub page (https://github.com/mojombo/chronic (https://github.com/mojombo/chronic)).

Let's see some examples:

```
/stats?from=10+days+ago

Returns stats for each of your services, by day, for the last ten days
```

```
/stats?from=1494793777&to=1494966577

Stats from Tuesday 14th May 2017 @ 20:29:37 UTC to Thursday 16th May 2017 @ 20:29:37 UTC
```

```
/stats?from=1%2F1%2F2017&to=2%2F1%2F2017

Daily stats from January 1st, 2017 (1/1/2017) to February 1st, 2017 (2/1/2017)
```

When the time of day is not specified, the Stats API assumes 12pm. To specify a midnight to midnight range, you would use `from=1%2F1%2F2013%2000:00&to=2%2F1%2F2013%2000:00` (from=1/1/2013 00:00&to=2/1/2013 00:00, before encoding).

The `from` parameter is "inclusive" and the `to` parameter is "exclusive". This means that we will return only rows with recorded times that match the following inequality:

```
1  from <= recorded < to
```

**NOTE:** We store historical stats information using UTC, and not local time zones. This means that we will use the UTC interpretations of your inputs when querying stats information.

**Param:** by
The `by` parameter allows you to control the sampling rate used to produce the result set from querying the Stats API. There are three values that can be set:

- `minute` - Stats will be sampled by minute for each recorded minute in the specified window
- `hour` - Sample by hour within the specified window
- `day` - Sample by day within the specified window

If you do not provide a `by` parameter in your query it will default to 'day'. Each sampling rate also specifies default `to` and `from` parameters if you omit them:

Each value for the `by` parameter has associated defaults for the `to` and `from` parameters if they are omitted, here’s an overview:

<table>
<thead>
<tr>
<th>URL</th>
<th>Default Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>/stats</td>
<td>By day, from 1 month ago, to now</td>
</tr>
<tr>
<td>/stats?by=hour</td>
<td>by hour, from 1 day ago, to now</td>
</tr>
<tr>
<td>/stats?by=minute</td>
<td>by minute, from 30 minutes ago, to now</td>
</tr>
</tbody>
</table>

It is important to remember the following conversions when performing queries:

- 1 day = 24 hours
- 1 hour = 60 minutes
- 1 day = 60 * 24 = 1,440 minutes

When changing the sampling rate via the `by` parameter you can accidentally ask for very large data sets if you have defined `to` and `from` parameters. We will not process exceedingly large queries. Please refer to the Response Format section below for more details.

**Param:** `region`
The Stats API also allows you to limit the scope of your query by restricting it to a particular region. This is achieved via the use of the `region` parameter. Currently the following regions are supported:

- `usa` - Restricts the query to statistics reported by POPs in the continental United States
- `europe` - Restricts the query to statistics reported by POPs in Europe
- `anzac` - Restricts the query to statistics reported by POPs in Australia and New Zealand
- `asia` - Restricts the query to statistics reported by POPs in Asia
- `asia_india` - Restricts the query to statistics reported by POPs in India
- `latam` - Restricts the query to statistics reported by POPs in Brazil
- `south_africa` - Restricts the query to statistics reported by POPs in southern Africa
- `southamerica_std` - Restricts the query to statistics reported by POPs in South America

Usage is exceedingly simple, let's look at some examples:

```
/stats
```

Returns stats for all regions

```
/stats?region=usa
```

Returns stats for only US POPs

```
/stats?region=europa
```

Returns stats for European POPs only

The following endpoint provides a complete list of all available regions:

```
GET /stats/regions
```

See the API section below for example output
Response Format

To make it easier to understand how a query is being processed we use a specific JSON response format. Here is an example:

```
/stats?from=1+day+ago
```

```
{
    "status": "success",
    "meta": {
        "to": "Thu May 16 20:08:35 UTC 2013",
        "from": "Wed May 15 20:08:35 UTC 2013",
        "by": "day",
        "region": "all"
    },
    "msg": null,
    "data": [ ... ]
}
```

Each of the fields denotes the following:

- **status** - Whether or not we were able to successfully execute the query
- **meta** - Meta information about the scope of the query in a human readable format
- **msg** - If the query was not successful this will provide a string that explains why
- **data** - This contains the actual results of the query that we processed

GET /stats/usage_by_month

Returns month-to-date usage details for a given month and year. Usage details are aggregated by service and across all Fastly services, and then grouped by region. This endpoint does not use the `from` or `to` fields for selecting the date for which data is requested. Instead, it uses `month` and `year` integer fields. Both fields are optional and default to the current month and year respectively. When set, an optional `billable_units` field will convert bandwidth to GB and divide requests by 10,000.

Authentication

API token (/api/auth#tokens).

Parameters

<td>month</td>
<td>integer</td>
<td>2-digit month.</td>
</tr>
<tr>

<td>4-digit year.</td>
</tr>
<tr>
<td>billable_units</td>

GET /stats/regions

Fetches the list of codes for regions that are covered by the Fastly CDN service.

Authentication

API token (/api/auth#tokens) with at least Billing permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

GET /stats/regions HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json
Real-time analytics (/api/analytics)

Fastly provides an HTTPS endpoint to poll for real-time analytics.

Endpoint

The base endpoint for the real-time analytics system is `https://rt.fastly.com`. All URLs are relative to that endpoint. All requests must be sent over HTTPS.

Authentication

To authenticate (/api/auth), use a `Fastly-Key` header containing your API token (/api/auth#tokens).

Channels

A channel ID is equivalent to a service ID, so each channel will provide real-time analytics for one service. The provided service ID must be owned by the account specified by the API token used for authentication.

There is a special channel ID demo which is used for the analytics on the fastly.com (https://www.fastly.com) homepage.

URL structure
For regular real-time analytics, this call allows you to get (and potentially wait for) any messages after a given timestamp. A message covers a one second interval:

1  <endpoint>/v1/channel/<service id>/ts/<timestamp in seconds>

For the first request, the timestamp can be 0. The response will then return a new timestamp field which should be used for the next request.

There is also "History" call for fetching data from the previous 120 seconds up to the latest timestamp for a channel:

1  <endpoint>/v1/channel/<service id>/ts/h

This can be modified by fetching the last \(N\) entries.

1  <endpoint>/v1/channel/<service id>/ts/h/limit/<N>

Response structure

The response is a JSON object. The top level object has two keys: Timestamp and Data. The Timestamp value should be extracted and used for the next API call, e.g.:

1. Set Timestamp to 0
2. Make API call
3. Set Timestamp to Timestamp value of returned JSON object
4. Do something with the rest of the data
5. Goto #2

The Data value is a JSON array. For regular real-time analytics calls, it will only have one or two items. For the history call, it will have as many items as were requested.

```json
{
    "Timestamp" => 1467915558,
    "Data" => [ ... ]
}
```

Each item is a JSON object with two keys: recorded is a Unix time stamp (e.g., seconds since Jan 1st, 1970) of when this data was generated on our cache servers, and datacenter with another JSON object as a value.
The keys of the `datacenter` JSON object are the names of each of our POPs (/guides/basic-concepts/fastly-pop-locations) around the world plus a special key, called `aggregated`, which adds all the values from all the POPs together.

The value of each of the POP keys is another JSON object that has various statistics. For example, here are the statistics for our San Jose POP during that time:
The keys are the same as those mentioned on the Historical Stats (/api/stats) page, but they show some statistics that have occurred since the last request, including the following:

- Number of requests
- Number of bytes transmitted in headers
- Number of bytes transmitted in bodies
- Number of hits
- Number of misses
- Number of synthetic responses
- Number of errors
- Amount of time spent delivering hits
- Amount of time spent delivering misses

The `miss_histogram` object is a JSON object. The keys are time buckets in 10s of milliseconds, and the values are the number of requests to origin. In this example provided above, 33 requests went to origin that took between 80 and 89 milliseconds to fetch.

The `miss_histogram` tops out at 60s. Any origin request that takes more than 60 seconds to return will be in the 60000 bucket.

## Rate limiting

The real-time analytics API is rate limited internally. However, it is also cached behind Fastly with an expiration time of 1s. Under normal use there should be no reason for customers to hit that rate limit.

## Remote Logging (/api/logging)

### S3

Fastly will upload log messages to the S3 bucket in the format specified in the S3 object.

⚠️ WARNING: Our Amazon S3 Canary logging endpoint will be deprecated (/guides/fastly-product-lifecycle/#product-or-feature-retirement) on October 31, 2019. It will not be supported beyond the deprecation date for existing users. It is no longer available to new customers. Our existing Amazon S3 logging endpoint (/guides/streaming-logs/log-streaming-amazon-s3), with its associated API (/api/logging#logging_s3), offers the same functionality as the deprecated logging endpoint, making the canary version unnecessary. Current users should migrate their logging endpoint to Amazon S3.

**S3 Canary**

Fastly will upload log messages to the S3 bucket in the format specified in the S3 Canary object.

⚠️ IMPORTANT: This feature is part of a limited availability release. For more information, see our product and feature lifecycle (/guides/fastly-product-lifecycle/#limited-availability) descriptions.

Syslog legacy paths

Our original syslog logging endpoints did not include /logging/ as part of the URL pattern. In 2017 we updated the URLs to match the URL pattern of our newer logging endpoints. We maintain the deprecated patterns (without /logging/) as a courtesy.

Utilities (/api/tools)

Content

Fastly makes it possible to see which version of a particular URL is cached on each edge server.

Actions

GET /content/edge_check

Retrieve headers and MD5 hash of the content for a particular URL from each Fastly edge server. This API is limited to 200 requests per hour.

Authentication

API token (/api/auth#tokens) of a user with at least Engineer permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions). This endpoint does not accept a token with the global:read scope.

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>string</td>
<td>Full URL (host and path) to check on all nodes. If protocol is omitted, http will be assumed</td>
</tr>
<tr>
<td>-----</td>
<td>--------</td>
<td>------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>

**Request Example**

```plaintext
GET /content/edge_check?url=www.example.com/foo/bar HTTP/1.1
Accept: application/json
```

**Response Example**

```plaintext
HTTP/1.1 200 OK
Content-Type: application/json
```

Public IP List

To help you manage firewall rules for connections from Fastly to your origin, we provide access to the list of Fastly's assigned IP ranges. Changes to this list will be announced in advance as an "IP address announcement" (example(https://status.fastly.com/incidents/b6jbikqrq0kq)) along with other service announcements to our status page (https://status.fastly.com/), which you can subscribe (/guides/debugging/fastlys-network-status#subscribing-to-notifications) to.

Actions

GET /public-ip-list

List the public IP addresses for the Fastly network.

Authentication

None.

Request Example

```
GET /public-ip-list HTTP/1.1
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

WAF (/api/waf)

Fastly offers a web application firewall (WAF) (/guides/web-application-firewall/) security service that allows you to detect malicious request traffic and log or log and block that traffic before it reaches your web application. The Fastly WAF provides rules that detect and block potential attacks. The rules are collected into a policy and deployed within your Fastly service at the edge.

⚠️ IMPORTANT: This feature is part of a limited availability release. Portions of this API may be subject to changes and improvements over time. Fields marked deprecated may be removed in the future and their use is discouraged. For more information, see our product and feature lifecycle (/guides/fastly-product-lifecycle/#limited-availability) descriptions.

Firewall

#### Request Example

```
GET /service/:service_id/version/:version/wafs HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/vnd.api+json
```

#### Response Example

```
HTTP/1.1 200 OK
Content-Type: application/vnd.api+json
```
GET /service/ service_id /version/ version /wafs/ waf_id

Get a specific firewall object.

Authentication

  }
}
Disable a firewall for a particular service and version. This endpoint is intended to be used in an emergency. Disabling a firewall object for a specific service and version replaces your existing WAF ruleset with an empty ruleset. While disabled, your WAF ruleset will not be applied to your origin traffic. This endpoint is only available to users assigned the role of superuser or above. This is an asynchronous action. To check on the completion of this action, use the related link returned in the response to check on the Update Status of the action.

Authentication

API token (/api/auth#tokens) with at least Superuser permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Request Example

```
PATCH /wafs/:id/disable HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/vnd.api+json
Accept: application/vnd.api+json

{
  "data": {
    "id": "WAF_ID",
    "type": "waf"
  }
}
```

Response Example

```
HTTP/1.1 202 Accepted
Content-Type: application/vnd.api+json
```
PATCH /wafs/id/enable

Re-enable a firewall object for a particular service and version after it has been disabled. This endpoint is intended to be used in an emergency. When a firewall object is re-enabled, a newly generated WAF ruleset VCL based on the current WAF configuration is used to replace the empty ruleset. This endpoint is only available to users assigned the role of superuser or above. This is an asynchronous action. To check on the completion of this action, use the related link returned in the response to check on the Update Status of the action.

Authentication

API token (/api/auth#tokens) with at least Superuser permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).
Request Example

```
PATCH /wafs/:id/enable HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/vnd.api+json
Accept: application/vnd.api+json

{
    "data": {
        "id": "WAF_ID",
        "type": "waf"
    }
}
```

Response Example

```
HTTP/1.1 202 Accepted
Content-Type: application/vnd.api+json
```
GET /wafs

List all active firewall objects.

Authentication

## Actions

```
GET /service/ service_id /wafs/ waf_id /ruleset
```
Get a WAF ruleset for a particular service and firewall object.

Authentication

API token (/api/auth#tokens) with at least Billing permissions (/guides/user-access-and-control/configuring-user-roles-and-permissions).

Parameters

}
```

```
GET /service/ service_id /wafs/ waf_id /ruleset/preview
```

Get a preview of the WAF ruleset VCL for a particular service and firewall object based on changes to WAF configuration before deploying the ruleset. The response will include a link to status of the background VCL generation job. Once the background job is completed, the preview WAF ruleset VCL can be retrieved from the status response.

Authentication
