API

Authentication

To use the Fastly API you will need to create a valid API token. This token will be used to authenticate your API requests.

API tokens

API tokens are unique authentication identifiers that you can create for the users and applications authorized to interact with your account and services. You can limit the capabilities of tokens using a scope. For example, the `purge_select` scope will limit a token to only be able to purge by URL and surrogate keys. The default `global` scope will grant the token access to all the service and account-level capabilities of the user that created the token. You can optionally restrict the service-level access of a token to one or more services. However, for a token with the `global` or `global:read` scope, limiting service access does not limit access to non-service related endpoints. Because users can create multiple API tokens, you can rotate tokens without taking services offline, and you can revoke individual tokens without having to update other API integrations.

Managing tokens with the web interface

You can use the Fastly web interface to create, view, and delete API tokens associated with your personal account. Superusers can view and delete any of the API tokens associated with the organization’s Fastly account. See Using API tokens for more information.

Two-factor authentication

API tokens support two-factor authentication. Send the generated one-time password via the Fastly-OTP header when creating a token, as shown below.

```
1 POST https://api.fastly.com/tokens
2 Fastly-OTP: 123456
3 username=youremail@example.com&password=PASSWORD
```

Availability

All endpoints that support the legacy API keys also support API tokens. In addition to checking if the user is authenticated, the API will check if the user’s role is authorized to perform the requested action. For example, billing endpoints will require an API token issued by a billing user (or superuser).

Access

You can limit a token’s capabilities using scopes, and you can limit a token’s authorizations by defining only those services you want it to access. Limiting a token’s service access does not prevent the token from accessing non-service related endpoints.

Scopes

Scopes can be used to limit a token’s capabilities. The following scopes are currently supported:

- `global`: This is the default scope covering all supported capabilities. This scope grants the same access level as legacy API keys.
- `purge_select`: Allows purging with surrogate key and URL. Disallows purging with purge all.
- `purge_all`: Allows purging an entire service via `purge_all`.
- `global:read`: Allows read-only access to account information, configuration, and stats.

To create a token with a single scope, specify the scope name in the body of the POST request. To create a token with multiple scopes, separate the names with a space (e.g., `scope=purge_all purge_select global:read`).

Services

Tokens are granted access to all services in an account by default. However, you can optionally restrict the service-level access of a token to one or more services. Do this by specifying an array in the POST `/tokens` action (e.g., `services[]=id1&services[]=id2`).

Note that limiting service access is designed to be used with the `purge-all` and `purge-select` scopes. A service-limited token with the `global` or `global:read` scopes will still be able to access non-service related endpoints. All service-limited tokens are prevented from modifying service authorizations, inviting new users to the account, and creating and modifying users.
Expiration
You can optionally set API tokens to expire at a specified date and time. After a token expires, using it for any request will return an HTTP 401 response. Specify the expiration date by using the \texttt{expires\_at} parameter in the POST \texttt{/tokens} action. Format the date and time in ISO 8601 format (e.g., \texttt{2016-07-28T19:24:50+00:00}).

Using API tokens
To authenticate API requests, a valid Fastly API token should be included in the \texttt{Fastly-Key} HTTP header.

Deleting a user with active tokens
To delete a user who has active API tokens associated with their account, you must first revoke the user's API tokens.

Limitations
API tokens currently have the following limitations:

- Tokens are always associated with the user who created them. This cannot be updated.
- When you generate a new token, you should store it in a safe place and keep it secret. For security reasons, you won't be able to retrieve the token later.
- There is a limit of 100 tokens per user. Deleted and expired tokens don't count against the limit.
- Tokens carry the same permission model as the user. For example, if you are a billing user, then your token will only allow you to perform the capabilities of the billing role.

Actions
GET \texttt{/tokens}
List all tokens belonging to the authenticated user.

Authentication
API token.

Request Example

GET \texttt{/tokens} HTTP/1.1
\texttt{Fastly-Key: YOUR_FASTLY_TOKEN}
\texttt{Accept: application/json}
GET /customer/ id /tokens

List all tokens belonging to a specific customer

Authentication
API token.

Request Example

```
GET /customer/:id/tokens
```

```
HTTP/1.1 200 OK
Content-Type: application/json

POST /tokens

Create an API token. If two-factor authentication is enabled for your account, review the instructions for including a one-time password in the request.

**Authentication**

Username and password.

**Request Example**

```
POST /tokens HTTP/1.1
Content-Type: application/x-www-form-urlencoded
Accept: application/json

$username=me@example.com&password=secret&services[]=5VqE6MOOy1QPJbqmCK41pY&services[]=6VqE6MOOy1QPJbqmCK41pZ&expires_at=2016-07-28T19:24:50Z"
```

**Response Example**

```

```

DELETE /tokens/self

Revoke a token that is used to authenticate the request.

**Authentication**

API token.

**Request Example**

```
DELETE /tokens/self HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```
HTTP/1.1 204 No Content
Content-Type: application/json
```

DELETE /tokens/ id
Revoke a specific token by its id.

Authentication

API token.

Request Example

```
DELETE /tokens/5Yo3XXknrQpjc20u0ybrf2g HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

\* Response Example

```
HTTP/1.1 204 No Content
Content-Type: application/json
```

DELETE /tokens

Revoke Tokens in bulk format. Users may only revoke their own tokens. Superusers may revoke tokens of others.

Authentication

API token.

Request Example

```
DELETE /tokens HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/vnd.api+json; ext=bulk
Content-Type: application/vnd.api+json; ext=bulk

Content-Type: application/vnd.api+json; ext=bulk
```

Troubleshooting

If the Fastly API returns an error message while you’re working with API tokens, use the following information to troubleshoot the issue.

POST /tokens

A response with a JSON body containing an error code is returned on error.

<table>

<tr>
<th>HTTP response code</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400</td>
<td>invalid_grant</td>

</tr>
</tbody>
</table>

**GET /tokens**
- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.

**GET /tokens/self**
- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.

**DELETE /tokens/:token_id**
- An HTTP 400 response is returned on revocation error.
- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.
- An HTTP 404 response is returned on failed token lookup.

**DELETE /tokens/self**
- An HTTP 400 response is returned on revocation error.
- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.

**Legacy API keys**
If you created a Fastly account before May 15th, 2017, you may have used an API key (or multiple API keys) to authenticate API requests. This account-level credential was migrated to a personal API token with a global scope and access to all of your services. Because all tokens need to be owned by a user, this credential was assigned to a newly created, synthetic user with the name Global API Token.

GET /billing/v2/account_customers/customer_id/mtd_invoice

Get the current month-to-date estimate.

This endpoint has two different responses. Under normal circumstances, it generally takes less than 5 seconds to generate but in
certain cases can take up to 60 seconds. Once generated the month-to-date estimate is cached for 4 hours, and is available the next request will return the JSON representation of the month-to-date estimate.

While a report is being generated in the background, this endpoint will return a 202 Accepted response. The full format of which can be found in detail in our billing calculation guide.

There are certain accounts for which we are unable to generate a month-to-date estimate. For example, accounts who have parent-pay are unable to generate an MTD estimate. The parent accounts are able to generate a month-to-date estimate but that estimate will not include the child accounts amounts at this time.

Authentication

API token of a user with at least Billing permissions.

### Actions

**GET /events**

List all events for a particular customer

**Authentication**

API token.

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
</table>
### GET /events

Limit the returned events to a specific timestamp. Accepts parameters: `gt`, `gte`, `lt`, `lte` (e.g., `filter[created_at][gt]=2019-01-01`). Parameters can be combined. If `filter[created_at]` is not present on the request, events within the past year are returned.

Invitations

Invitations allow superusers and engineers to invite users to set up accounts as collaborators under a main customer account. Superusers can invite collaborators and assign them any role or permission level on a per-service basis. Engineers with no per-service limitations on their role can only invite new collaborators but cannot modify their permissions.

### Actions

**GET /current_user**

Get the logged in user

**Authentication**

API token.

**Request Example**

```text
GET /current_user HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```json

  "two_factor_setup_required": false,
  "updated_at": "2016-06-20T16:45:18+00:00"
}
```

**GET /user/ id**

Get a specific user

**Authentication**

API token.

**Request Example**

```text
GET /user/x9KZsrACXZv8tPwlEDsKb6 HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```json
HTTP/1.1 200 OK
Content-Type: application/json

```
POST /user

Create a user

Authentication
API token with at least [Superuser permissions].

Request Example

```plaintext
POST /user HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/x-www-form-urlencoded
Accept: application/json

name=Kris Owner&login=krisowner@example.com
```

Response Example

```json

}
```

POST /current_user/password

Update the user’s password to a new one

Authentication
Username and password.

Request Example

```plaintext
POST /current_user/password HTTP/1.1
Content-Type: application/x-www-form-urlencoded

old_password=oldpasswd&new_password=newpwd
```

Response Example

```json
HTTP/1.1 200 OK
Content-Type: application/json

{ }
```

POST  /user/login

Requests a password reset for the specified user

Authentication

None.

Request Example

```
POST /user/%40example.com/password/request_reset HTTP/1.1
Accept: application/json
```

▼ Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "status": "ok"
}
```

PUT  /user/id

Update a user. Only users with the role of `superuser` can make changes to other users on the account. Non-superusers may use this endpoint to make changes to their own account. Modifications to `login` email require a valid password in the request body. Two-factor attributes are not editable via this endpoint.

Authentication

API token.

Request Example

```
PUT /user/x9KzsrACXt8tPwlEDxKb6 HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/x-www-form-urlencoded
Accept: application/json

name=Updated%20Name&login=krisowner@example.com&password_confirmation=YOUR_FASTLY_PASSWORD
```

▼ Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

```
DELETE /user/ id

Delete a user

Authentication
API token with at least Superuser permissions.

Request Example

```
DELETE /user/x9KzsrACXZv8tPwlEDsKb6 HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "status": "ok"
}
```

Config

ACL

An ACL is a named access control list for matching against a client's IP address during VCL processing. A new ACL is empty and is attached to a working version of a service (not locked or active). The version associated with the ACL must be activated to be used. To remove an ACL from use, the ACL must be deleted from a working version (not locked or active), and that version without the ACL must be activated.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>string</td>
<td>Name for the ACL. Must start with alphanumeric and contain only alphanumeric, underscore, and whitespace.</td>
</tr>
</tbody>
</table>

Actions

GET /service/ service_id /version/ version /acl

List ACLs

Authentication
API token of a user with at least Engineer permissions.

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/2/acl HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

Response Example

```
```
GET /service/service_id/version/version/acl/name

Retrieve a single ACL by name for the version and service

Authentication
API token of a user with at least Engineer permissions.

Request Example
GET /service/SU1Z0isxPaozGVKXdv0eY/version/4/acl/my_acl HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

Response Example
HTTP/1.1 200 OK
Content-Type: application/json

POST /service/service_id/version/version/acl

Create a new ACL for a particular service and version

Authentication
API token of a user with at least Engineer permissions.

Request Example
POST /service/SU1Z0isxPaozGVKXdv0eY/version/4/acl HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/x-www-form-urlencoded
Accept: application/json

name=my_acl

Response Example
HTTP/1.1 200 OK
Content-Type: application/json
PUT /service/service_id/version/version/acl/old_name

Update ACL for a particular service and version

Authentication

API token of a user with at least [Engineer permissions](#).

Request Example

```
PUT /service/SU1Z0iixsPaozGVKXdv0eY/version/4/acl/my_acl HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/x-www-form-urlencoded
Accept: application/json

  "deleted_at": null
}
```

DELETE /service/service_id/version/version/acl/name

Delete an ACL for a particular service and version

Authentication

API token of a user with at least [Engineer permissions](#).

Request Example

```
DELETE /service/SU1Z0iixsPaozGVKXdv0eY/version/1/acl/my_acl HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

▼ Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "status": "ok"
}
```

ACL Entry

An ACL entry holds an IP address with optional subnet to make up an entry in an ACL. ACL entries are versionless and can be modified without activating a new version. ACL entries can also be negated.

**Fields**
### GET /service/service_id/acl/acl_id/entries

List of ACL entries given service and ACL ID

**Authentication**

API token of a user with at least Engineer permissions.

**Request Example**

```
GET /service/SU1Z0isxPaozGVKXdv0eY/acl/2cFflPOskFLhmnJJEfUake/entries HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

<tr>
<td>cache_condition</td>
<td>string</td>
<td>Name of the condition used to test whether this settings object should be used.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name for the cache settings object.</td>
</tr>
<tr>
<td>stale_ttl</td>
<td>integer</td>
<td>Sets the max &quot;Time To Live&quot; for stale (unreachable) objects.</td>
</tr>
</tbody>
</table>
### Actions

**GET** `/service/service_id/version/cache_settings`

Get a list of all cache settings for a particular service and version.

**Authentication**

API token of a user with at least **Engineer permissions**.

**Request Example**

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/cache_settings HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json

[
  {
    "action": "cache",
    "cache_condition": "",
    "name": "testcache",
    "service_id": "SU1Z0isxPaozGVKXdv0eY",
    "stale_ttl": "1200",
    "ttl": "3600",
    "version": "1"
  }
]
```

**GET** `/service/service_id/version/cache_settings/name`

Get a specific cache settings object.

**Authentication**

API token of a user with at least **Engineer permissions**.

**Request Example**

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/cache_settings/testcache HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "action": "cache",
  "cache_condition": "",
  "name": "testcache",
  "service_id": "SU1Z0isxPaozGVKXdv0eY",
  "stale_ttl": "1200",
  "ttl": "3600",
  "version": "1"
}
```

**POST** `/service/service_id/version/cache_settings`

Create a cache settings object.

**Authentication**

API token of a user with at least **Engineer permissions**.

**Request Example**
**PUT /service/service_id/version/version/cache_settings/old_name**

Update a specific cache settings object.

Authentication

**API token** of a user with at least **Engineer permissions**.

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_name</td>
<td>string</td>
<td>Old name of the cache settings object (used to select the correct cache settings object if the name has been changed).</td>
</tr>
</tbody>
</table>

**Request Example**

```
PUT /service/SU1Z0isxPaozGVKXdv0eY/version/1/cache_settings/testcache HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/x-www-form-urlencoded
Accept: application/json

stale_ttl=2000&ttl=1000
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "action": "cache",
    "cache_condition": "",

    "stale_ttl": "1200",
    "ttl": "3600",
    "version": "1"
}
```

**DELETE /service/service_id/version/version/cache_settings/name**

Delete a specific cache settings object.

Authentication

**API token** of a user with at least **Engineer permissions**.

**Request Example**

```
DELETE /service/SU1Z0isxPaozGVKXdv0eY/version/1/cache_settings/testcache HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

---

**POST /service/SU1Z0isxPaozGVKXdv0eY/version/1/cache_settings** HTTP/1.1

**Fastly-Key**: YOUR_FASTLY_TOKEN

**Content-Type**: application/x-www-form-urlencoded

**Accept**: application/json

```plaintext
name=testcache&stale_ttl=1000&ttl=1000&action=cache
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "action": "cache",
    "cache_condition": "",
    "name": "testcache",

    "ttl": "3600",
    "version": "1"
}
```
### Condition

Conditions are used to control when and how other objects are used in a service configuration. They contain a statement that evaluates to either true or false and is used to determine whether the condition is met.

Depending on the type of the condition, the statement field can make reference to the Varnish Variables `req`, `resp`, or `beresp`.

#### Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>string</td>
<td>Name of the condition.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Priority assigned to condition. Order executes from 1 to 10, with 1 being first and 10 being last.</td>
</tr>
<tr>
<td>priority</td>
<td>integer</td>
<td>Type of the condition, either &quot;REQUEST&quot; (req), &quot;RESPONSE&quot; (req, resp), &quot;CACHE&quot; (req, beresp), or &quot;PREFETCH&quot; (req, bereq).</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>statement</td>
<td>string</td>
<td>The statement used to determine if the condition is met.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

#### Actions

**GET** /service/service_id/version/version/condition

Gets all conditions for a particular service and version.

Authentication

**API token** of a user with at least **Engineer permissions**.

#### Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/condition HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

#### Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

[  
  "comment": "",
  "name": "testcondition",
  "priority": "10",
  "service_id": "SU1Z0isxPaozGVKXdv0eY",
  "statement": "req.url.basename == "index.html"",
  "type": "CACHE",
  "version": "1"
]
```

**GET** /service/service_id/version/version/condition/name

Gets the specified condition.
Authentication

API token of a user with at least Engineer permissions.

Request Example

**POST** /service/SU1Z0isxPaozGVKXdv0eY/version/1/condition/testcondition

HTTP/1.1

Fastly-Key: YOUR_FASTLY_TOKEN

Accept: application/json

**Response Example**

HTTP/1.1 200 OK

Content-Type: application/json

```
{
  "comment": "",
  "name": "testcondition",
  "priority": "10",
  "service_id": "SU1Z0isxPaozGVKXdv0eY",
  "statement": "req.url.basename == "index.html"",
  "type": "CACHE",
  "version": "1"
}
```

**POST** /service/service_id/version/condition

Creates a new condition.

Authentication

API token of a user with at least Engineer permissions.

Request Example

**POST** /service/SU1Z0isxPaozGVKXdv0eY/version/1/condition

HTTP/1.1

Fastly-Key: YOUR_FASTLY_TOKEN

Content-Type: application/x-www-form-urlencoded

Accept: application/json

name=testcondition&statement=req.url.basename%20%3D%3D%20%22index.html%22&type=REQUEST&priority=10

**Response Example**

HTTP/1.1 200 OK

Content-Type: application/json

```
{
  "comment": "",
  "name": "testcondition",
  "priority": "10",
  "service_id": "SU1Z0isxPaozGVKXdv0eY",
  "statement": "req.url.basename == \"index.html\"",
  "type": "REQUEST",
  "version": "1"
}
```

**PUT** /service/service_id/version/condition/old_name

Updates the specified condition.

Authentication

API token of a user with at least Engineer permissions.

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_name</td>
<td>string</td>
<td>Old name of the condition object (used to select the correct condition object if the name has been changed).</td>
</tr>
</tbody>
</table>
**DELETE** /service/ service_id /version/ version /condition/ name

Deletes the specified condition.

**Authentication**

API token of a user with at least Engineer permissions.

**Request Example**

```
DELETE /service/SU1Z0isxPaozGVKXdv0eY/version/1/condition/testcondition HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "status": "ok"
}
```

**Dictionary**

A Dictionary is a table that stores key value pairs accessible to VCL functions during VCL processing. A new dictionary is empty and attached to a working version of a service (not locked/active). In order for the dictionary to appear in generated VCL, the version associated with the dictionary must be activated. To remove a dictionary, the dictionary must be deleted on a working version (not locked/active), and that version without the dictionary then must be activated.

**Fields**

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>created_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the dictionary was created.</td>
</tr>
<tr>
<td>deleted_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the dictionary was deleted.</td>
</tr>
<tr>
<td>id</td>
<td>string</td>
<td>The alphanumeric string identifying a dictionary.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name for the Dictionary.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>updated_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the dictionary was updated.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
<tr>
<td>write_only</td>
<td>boolean</td>
<td>Determines if items in the dictionary are readable or not.</td>
</tr>
</tbody>
</table>
Actions

GET /service/service_id/version/dictionary

List all dictionaries for the version of the service.

Authentication

API token of a user with at least Engineer permissions.

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/dictionary HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

[

  "version": 1,
  "write_only": false
}
]
```

GET /service/service_id/version/dictionary/name

Retrieve a single dictionary by name for the version and service.

Authentication

API token of a user with at least Engineer permissions.

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/dictionary/my_dictionary HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

Response Example

```

  "version": 1,
  "write_only": false
}
```

POST /service/service_id/version/dictionary

Create named dictionary for a particular service and version.

Authentication

API token of a user with at least Engineer permissions.

Request Example
**POST** /service/SU1Z0isxPaozGVXdxv0eY/version/1/dictionary  
HTTP/1.1  
Fastly-Key: YOUR_FASTLY_TOKEN  
Content-Type: application/x-www-form-urlencoded  
Accept: application/json  

name=my_dictionary

**Response Example**

```
HTTP/1.1 200 OK  
Content-Type: application/json

    "version": 1,
    "write_only": false
}
```

**PUT** /service/ service_id /version/ version /dictionary/ old_name

Update named dictionary for a particular service and version

Authentication

**API token** of a user with at least [Engineer permissions].

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_name</td>
<td>string</td>
<td>Old name of the dictionary object (used to select the correct dictionary object if the name has been changed).</td>
</tr>
</tbody>
</table>

**Request Example**

```
PUT /service/SU1Z0isxPaozGVXdxv0eY/version/1/dictionary/my_dictionary  
HTTP/1.1  
Fastly-Key: YOUR_FASTLY_TOKEN  
Content-Type: application/x-www-form-urlencoded  
Accept: application/json  

name=updated_dictionary
```

**Response Example**

```
HTTP/1.1 200 OK  
Content-Type: application/json

{
    "created_at": "2016-05-03T16:11:41+00:00",

    "version": 1,
    "write_only": false
}
```

**DELETE** /service/ service_id /version/ version /dictionary/ name

Delete named dictionary for a particular service and version.

Authentication

**API token** of a user with at least [Engineer permissions].

**Request Example**
DELETE /service/SU120isxPaozGVKXdv0eY/version/1/dictionary/my_dictionary HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

**Dictionary Info**

DictionaryInfo provides metadata for a Dictionary.

**Fields**

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>last_updated</td>
<td>string</td>
<td>Time-stamp (GMT) when the dictionary was last updated.</td>

<tr>
<td>item_count</td>
<td>integer</td>
<td>The number of items belonging to the dictionary.</td>
</tr>
<tr>
<td>digest</td>
<td>string</td>
<td>Hash of the dictionary content.</td>
</tr>
</tbody>
</table>

**Actions**

**GET /service/service_id/version/version/dictionary/id/info**

Retrieve metadata for a single dictionary by ID for a version and service.

Authentication

API token of a user with at least **Engineer permissions**.

**Request Example**

GET /service/SU120isxPaozGVKXdv0eY/version/1/dictionary/5clCytcTJrnvPi8wjqPH0q/info HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

**Response Example**

HTTP/1.1 200 OK  
Content-Type: application/json

```json
{
  "status": "ok"
}
```

**Dictionary Item**

A DictionaryItem holds a key and value that make up an entry in a Dictionary. DictionaryItems are versionless so they can be modified without activating a new version.

**Fields**

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>created_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the dictionary was created.</td>

<tr>
<td>dictionary_id</td>
<td>string</td>
<td>The dictionary for this Item.</td>
</tr>
<tr>
<td>item_key</td>
<td>string</td>
<td>Key for the DictionaryItem.</td>
</tr>
</tbody>
</table>
### GET /service/service_id/dictionary/dictionary_id/items

List of DictionaryItems given service and dictionary ID.

**Authentication**

**API token** of a user with at least *Engineer permissions*.

**Request Example**

```
GET /service/SU1Z0isxPaozGVKXdv0eY/dictionary/5clCytcTJrnvPi8wjqPH0q/items

HTTP/1.1

Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json

[
  {
    "dictionary_id": "5clCytcTJrnvPi8wjqPH0q",
    "service_id": "SU1Z0isxPaozGVKXdv0eY",

    "deleted_at": null,
    "updated_at": "2016-04-21T18:14:32+00:00"
  }
]
```

### GET /service/service_id/dictionary/dictionary_id/item/item_key

Retrieve a single DictionaryItem given service, dictionary ID and item key.

**Authentication**

**API token** of a user with at least *Engineer permissions*.

**Request Example**

```
GET /service/SU1Z0isxPaozGVKXdv0eY/dictionary/5clCytcTJrnvPi8wjqPH0q/item/some_key

HTTP/1.1

Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "dictionary_id": "5clCytcTJrnvPi8wjqPH0q",
    "service_id": "SU1Z0isxPaozGVKXdv0eY",

    "deleted_at": null,
    "updated_at": "2016-04-21T18:14:32+00:00"
}
```

### POST /service/service_id/dictionary/dictionary_id/item

Create DictionaryItem given service, dictionary ID, item key, and item value.

**Actions**

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item_value</td>
<td>string</td>
<td>Value for the DictionaryItem.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The service the Dictionary belongs to.</td>
</tr>
<tr>
<td>updated_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the dictionary was updated.</td>
</tr>
</tbody>
</table>
**Authentication**  

**API token** of a user with at least Engineer permissions.

**Request Example**

```
PUT /service/SU1Z0isxPaozGVKXdv0eY/dictionary/5clCytcTJrvnP18wqgPH0q/item HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/x-www-form-urlencoded
Accept: application/json

item_key=some_key&item_value=some_value
```

▼ **Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "dictionary_id": "5clCytcTJrvnP18wqgPH0q",
    "service_id": "SU1Z0isxPaozGVKXdv0eY",

}
```

**PUT /service/service_id/dictionary/dictionary_id/item/item_key**

Upsert DictionaryItem given service, dictionary ID, item key, and item value.

**Authentication**  

**API token** of a user with at least Engineer permissions.

**Request Example**

```
PUT /service/SU1Z0isxPaozGVKXdv0eY/dictionary/5clCytcTJrvnP18wqgPH0q/item/some_key HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/x-www-form-urlencoded
Accept: application/json

}
```

**PATCH /service/service_id/dictionary/dictionary_id/item/item_key**

Update DictionaryItem given service, dictionary ID, item key, and item value.

**Authentication**  

**API token** of a user with at least Engineer permissions.

**Request Example**

```
PATCH /service/SU1Z0isxPaozGVKXdv0eY/dictionary/5clCytcTJrvnP18wqgPH0q/item/some_key HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/x-www-form-urlencoded
Accept: application/json

item_value=new_value
```
**Response Example**

```
HTTP/1.1 200 OK

  "updated_at": "2016-04-21T18:14:32+00:00"
}
```

**PATCH**  
`/service/ service_id /dictionary/ dictionary_id /items`

Update DictionaryItem in batch for given service, dictionary ID and key/value pairs for items.

**Authentication**

API token of a user with at least Engineer permissions.

**Request Example**

```
PATCH /service/SU1Z0isxPaozGVKXdv0eY/dictionary/5clCytcTJrnvPi8wjgPH0q/items HTTP/1.1

Content-Type: application/json

{
  "status": "ok"
}
```

**DELETE**  
`/service/ service_id /dictionary/ dictionary_id /item/ item_key`

Delete DictionaryItem given service, dictionary ID, and item key.

**Authentication**

API token of a user with at least Engineer permissions.

**Request Example**
**Diff**

See the changes in configuration between two different versions of a service.

### Fields

**Director**

A Director is responsible for balancing requests among a group of Backends. In addition to simply balancing, Directors can be configured to attempt retrying failed requests. Additionally, Directors have a quorum setting which can be used to determine when the Director as a whole is considered "up", in order to prevent "server whack-a-mole" following an outage as servers come back up.

Only directors created via the API can be modified via the API. Directors known as "autodirectors" that are created automatically when load balancing groups of servers together cannot be modified or retrieved via the API.

**Fields**

**PUT** /service/service_id/version/version/director/name

Update the director for a particular service and version

Authentication

**API token** of a user with at least **Engineer permissions**.

**Request Example**

```plaintext
```
DELETE /service/service_id/version/version/director/name

Delete the director for a particular service and version

Authentication

API token of a user with at least Engineer permissions.

Request Example

DELETE /service/SU1Z0isxPaozGVKXdv0eY/version/1/director/test-director HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json

Director Backend

Maps and relates backends as belonging to directors. Backends can belong to any number of directors but directors can only hold one reference to a specific backend.

**Fields**

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>backend_name</td>
<td>string</td>
<td>Name of the backend to map to the specified director.</td>
</tr>
<tr>
<td>created_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the relationship was created.</td>
</tr>
<tr>
<td>deleted_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the relationship was deleted.</td>
</tr>
<tr>
<td>director</td>
<td>string</td>
<td>Name of the director.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>updated_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the relationship was updated.</td>
</tr>
</tbody>
</table>
**Actions**

**GET /service/service_id/version/director/director_name/backend/backend_name**

Returns the relationship between a Backend and a Director. If the Backend has been associated with the Director, it returns a simple record indicating this. Otherwise, returns a 404.

**Authentication**

*API token* of a user with at least *Engineer permissions*.

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>director_name</td>
<td>string</td>
<td>The director name.</td>
</tr>
</tbody>
</table>

**Request Example**

```plaintext
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/director/test-director/backend/test-backend HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```json
HTTP/1.1 200 OK
Content-Type: application/json;charset=utf-8

{
  "backend_name": "test-backend",
  "created_at": "2016-05-05T20:26:56+00:00",
  "deleted_at": null,
  "director_name": "test-director",
  "service_id": "SU1Z0isxPaozGVKXdv0eY",
  "updated_at": "2016-05-05T20:26:56+00:00",
  "version": 1
}
```

**POST /service/service_id/version/director/director_name/backend/backend_name**

Establishes a relationship between a Backend and a Director. The Backend is then considered a member of the Director and can be used to balance traffic onto.

**Authentication**

*API token* of a user with at least *Engineer permissions*.

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>director_name</td>
<td>string</td>
<td>The director name.</td>
</tr>
</tbody>
</table>

**Request Example**

```plaintext
POST /service/SU1Z0isxPaozGVKXdv0eY/version/1/director/test-director/backend/test-backend HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```json
HTTP/1.1 200 OK
Content-Type: application/json;charset=utf-8
```
DELETE /service/service_id/version/director/director_name/backend/backend_name

Deletes the relationship between a Backend and a Director. The Backend is no longer considered a member of the Director and thus will not have traffic balanced onto it from this Director.

Authentication

API token of a user with at least Engineer permissions.

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>director_name</td>
<td>string</td>
<td>The director name.</td>
</tr>
</tbody>
</table>

Request Example

DELETE /service/SU1Z0i8sxaGvGve0eY/version/1/director/test-director/backend/test-backend HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json; charset=utf-8

{
    "status": "ok"
}

Domain

A domain represents the domain name through which visitors will retrieve content. There can be multiple domains for a service.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>string</td>
<td>A personal freeform descriptive note.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>The name of the domain or domains associated with this service.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

Actions

GET /service/service_id/version/domain/check_all

Checks the status of all domains’ DNS records for a Service Version. Returns an array of 3 items. The first is the details for the domain, the second is the current CNAME of the domain, and the third is a boolean indicating whether or not it has been properly setup to use Fastly.

Authentication

API token of a user with at least Engineer permissions.

Request Example

GET /service/SU1Z0i8sxaGvGve0eY/version/1/domain/check_all HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
GET /service/ service_id /version/ version /domain/ name /check

Checks the status of a specific domain's DNS record for a Service Version. Returns an array in the same format as domain/check_all.

Authentication
API token of a user with at least Engineer permissions.

Request Example
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/domain/www.example.com/check HTTP/1.1

  'global.prod.fastly.net.',
  true
]

GET /service/ service_id /version/ version /domain

List all the domains for a particular service and version

Authentication
API token of a user with at least Engineer permissions.

Request Example
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/domain HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN

]
GET /service/service_id/version/domain/name

Get the domain for a particular service and version

Authentication
API token of a user with at least Engineer permissions.

Request Example
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/domain/www.example.com HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

Response Example

}

PUT /service/service_id/version/domain/old_name

Update the domain for a particular service and version

Authentication
API token of a user with at least Engineer permissions.

Parameters
DELETE /service/service_id/version/dname

Delete the domain for a particular service and versions

Authentication
API token of a user with at least Engineer permissions.

Request Example
DELETE /service/SU120isxPaozGVKKdovYeY/version/1/domain/test-domain HTTP/1.1

Healthcheck

Healthchecks are used to customize the way Fastly checks on your Backends. If an origin server is marked unhealthy due to health checks, Fastly will stop attempting to send requests to it. If all origin servers are marked unhealthy, Fastly will attempt to serve stale. If no stale object is available, a 503 will be returned to the client.

Fields

<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>string</td>
<td>Allows you to terminate request handling and immediately perform an action. When set it can be lookup or pass (ignore the cache completely).</td>
</tr>
<tr>
<td>bypass_busy_wait</td>
<td>boolean</td>
<td>Disable collapsed forwarding, so you don’t wait for other objects to origin.</td>
</tr>
<tr>
<td>default_host</td>
<td>string</td>
<td>Sets the host header.</td>
</tr>
<tr>
<td>force_miss</td>
<td>boolean</td>
<td>Allows you to force a cache miss for the request. Replaces the item in the cache if the content is cacheable.</td>
</tr>
<tr>
<td>force_ssl</td>
<td>boolean</td>
<td>Forces the request use SSL (redirects a non-SSL to SSL).</td>
</tr>
</tbody>
</table>
### GET /service/service_id/version/version/request_settings

<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cache_condition</td>
<td>string</td>
<td>Name of the condition checked after we have retrieved an object. If the condition passes then deliver this Request Object instead.</td>
</tr>
<tr>
<td>content</td>
<td>string</td>
<td>The content to deliver for the response object, can be empty.</td>
</tr>
<tr>
<td>content_type</td>
<td>string</td>
<td>The MIME type of the content, can be empty.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name that identifies the Response Object.</td>
</tr>
<tr>
<td>field</td>
<td>type</td>
<td>description</td>
</tr>
<tr>
<td>-----------</td>
<td>--------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>status</td>
<td>string</td>
<td>The HTTP Status Code, defaults to 200.</td>
</tr>
<tr>
<td>response</td>
<td>string</td>
<td>The HTTP Response, defaults to &quot;Ok&quot;</td>
</tr>
<tr>
<td>request_condition</td>
<td>string</td>
<td>Name of the condition to be checked during the request phase. If the condition passes then this object will be delivered.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

**Actions**

**GET** /service/service_id/version/version/response_object

Returns all Response Objects for the specified service and version.

**Authentication**

API token of a user with at least **Engineer permissions**.

**Request Example**

```plaintext

Actions

GET /service/service_id/ version/ settings

Get the settings for a particular service and version

Authentication

API token of a user with at least Engineer permissions.

Request Example

GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/settings HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

▼ Response Example

HTTP/1.1 200 OK
Content-Type: application/json

{
  "general.default_host": "",
  "general.default_ttl": 3600,
  "general.stale_if_error": false,

  "service_id": "SU1Z0isxPaozGVKXdv0eY",
  "version": 1
}

PUT /service/service_id/ version/ settings

Update the settings for a particular service and version.

NOTE: If you override TTLs with custom VCL, any general.default_ttl value will not be honored and the expected behavior may change.

Authentication

API token of a user with at least Engineer permissions.

Request Example

PUT /service/SU1Z0isxPaozGVKXdv0eY/version/1/settings HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

general.default_ttl=4242&general.default_host=www.example.com

▼ Response Example

HTTP/1.1 200 OK
Content-Type: application/json

{
  "general.default_host": "www.example.com",
  "general.default_ttl": 7200,
  "general.stale_if_error": false,

  "version": 1
}

Stats

Stats give you information on the usage and performance of your Service. They can be request by Service and over a particular time span. Stats are broken down per datacenter, giving you information on how your Services are being used across the world. There is now a more flexible, and fully featured Stats API available.

Fields

### Actions

**GET** `/service/service_id/stats/summary`

Get the stats from a service for a block of time. This lists all stats by PoP location, starting with AMS. This call **requires** parameters to select block of time to query. Use either a timestamp range (using `start_time` and `end_time`) or a specified month/year combo (using `month` and `year`)

Authentication

**API token.**

**Request Example**

```
GET /service/SU1Z0isxPaozQVXKdv0eY/stats/summary?year=2013&month=7 HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json

</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

**Actions**

**GET /service service_id /version version /vcl**

List the uploaded VCLs for a particular service and version

Authentication

**API token** of a user with at least [Engineer permissions](https://docs.fastly.com/api/aio).

**Request Example**

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/vcl HTTP/1.1

```

**GET /service service_id /version version /boilerplate**

Return boilerplate VCL with the service’s TTL from the settings.

Authentication

**API token** of a user with at least [Engineer permissions](https://docs.fastly.com/api/aio).

**Request Example**

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/boilerplate HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

**Response Example**

```

Dynamic Servers

Fastly’s Load Balancer allows you to create pools of origin servers that you dynamically manage using Dynamic Servers to distribute and direct incoming requests. To set up Dynamic Servers, you attach a pool to a service, then add versionless origin server that are stored separately from your VCL configuration. You can use the Fastly API to programmatically add, remove, and update pools and origin servers.

**IMPORTANT:** This information is part of a limited availability release. For more information, see our product and feature lifecycle descriptions.
API Reference

Pool
A pool is responsible for balancing requests among a group of servers. In addition to balancing, pools can be configured to attempt retrying failed requests. Pools have a quorum setting that can be used to determine when the pool as a whole is considered up, in order to prevent problems following an outage as servers come back up.

Server

A server is an address (IP address or hostname) to which the Fastly Load Balancer service can forward requests. This service can define multiple servers and assign it to a pool. Fastly can then select any one of these servers based on a selection policy defined for the pool.

**Purge**

**Purging**

Instant Purging removes content from Fastly immediately so it can be refreshed from your origin servers. The main entry point for the API, [https://api.fastly.com/](https://api.fastly.com/), is not needed for an individual URL Instant Purge.

**Actions**

```
PURGE *
```

Instant Purge an individual URL.

Authentication

Disabled by default. See [Authenticating URL purge requests via API](#) to enable.

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>string</td>
<td>Full path of the URL.</td>
</tr>
</tbody>
</table>

**Request Example**

```
```
POST /service/service_id/purge_all

Instant Purge everything from a service.

Authentication
API token of a user with at least Engineer permissions.

Request Example

```bash
POST /service/SU1Z0isxPaozGVKxdv0eY/purge_all HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/json
```

Response Example

```json
HTTP/1.1 200 OK
Content-Type: application/json

{
  "status": "ok",
  "id": "108-1391560174-974124"
}
```

POST /service/service_id/purge/key

Instant Purge a particular service of items tagged with a Surrogate Key. Only one surrogate key can be purged at a time. Multiple keys can be purged using a batch surrogate key purge request.

Authentication
API token.

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>string</td>
<td>Surrogate Key to purge.</td>
</tr>
</tbody>

```

**Soft Purging**

Soft Purging sets an object’s TTL to 0s, forcing revalidation. For best results, Soft Purging should be used in conjunction with stale_while_revalidate and stale_if_error. The main entry point [https://api.fastly.com/](https://api.fastly.com/) for the API is not needed for a single URL Soft Purge.

**Actions**

* **PURGE** *

Soft Purge an individual URL.

**Authentication**

Disabled by default. See Authenticating URL purge requests via API to enable.

## Historical Stats

### Historical Stats

The Fastly historical Stats API allows you to programmatically retrieve historical caching statistics derived from your Fastly services. You can use these metrics to help you optimize your site's data caching and analyze your site's traffic.

### Endpoint

The base endpoint for the Stats API is [https://api.fastly.com/](https://api.fastly.com/). All URLs are relative to that endpoint. All requests must be sent over HTTPS.

### Authentication

To authenticate, use a `Fastly-Key` header containing your API token.

Here's an example using the command-line tool cURL:

```bash
curl -H "Fastly-Key: YOUR_FASTLY_TOKEN" https://api.fastly.com/stats
```

### Availability of Data

As a general rule, minutely, hourly, and daily data will each be delayed by approximately 10 to 15 minutes from the current time due to the time it takes to collect and process historical data. In addition, the current hour and current day will only return partial results because the data is still being incrementally aggregated for that time period, which isn't complete.

**IMPORTANT:** You cannot retrieve minutely historical statistics data older than 90 days from the current date. Contact [support@fastly.com](mailto:support@fastly.com) to discuss your minutely data needs.

### Query Options (Time Range, Sampling Rate, and Regions)
There are four query parameters that you can use to specify what information is returned by the stats API. The `from` and `to` parameters control the window over which you want to fetch stats information. The `by` controls the sampling rate (day, hour, or minute). And the `region` parameter allows you to restrict the result set to a particular region.

**Param: from and to**

The `from` and `to` parameters are exact times that control the window over which to fetch historical statistics. By default you can use UNIX timestamps when specifying these parameters, but many forms of human readable inputs are also available, such as:

- `Yesterday`
- `Two weeks ago`
- `2/20/2013`

Date parsing is performed using the Chronic ruby library; for the most detailed information on exactly what formats are available please visit the gem’s GitHub page (https://github.com/mojombo/chronic).

Let’s see some examples:

```
/stats?from=10+days+ago
```

Returns stats for each of your services, by day, for the last ten days

```
/stats?from=1494793777&to=1494966577
```

Stats from Tuesday 14th May 2017 @ 20:29:37 UTC to Thursday 16th May 2017 @ 20:29:37 UTC

```
/stats?from=1/1/2017&to=2/1/2017
```

Daily stats from January 1st, 2017 (1/1/2017) to February 1st, 2017 (2/1/2017)

When the time of day is not specified, the Stats API assumes 12pm. To specify a midnight to midnight range, you would use `from=1/1/2013 00:00&to=2/1/2013 00:00` (before encoding).

The `from` parameter is “inclusive” and the `to` parameter is "exclusive". This means that we will return only rows with recorded times that match the following inequality:

```
from <= recorded < to
```

**NOTE:** We store historical stats information using UTC, and not local time zones. This means that we will use the UTC interpretations of your inputs when querying stats information.

**Param: by**

The `by` parameter allows you to control the sampling rate used to produce the result set from querying the Stats API. There are three values that can be set:

- `minute` - Stats will be sampled by minute for each recorded minute in the specified window
- `hour` - Sample by hour within the specified window
- `day` - Sample by day within the specified window

If you do not provide a `by` parameter in your query it will default to ‘day’. Each sampling rate also specifies default `to` and `from` parameters if you omit them:

Each value for the `by` parameter has associated defaults for the `to` and `from` parameters if they are omitted, here’s an overview:

```
/stats
```

Defaults to: By day, from 1 month ago, to now

```
/stats?by=hour
```

```
/stats?by=minute
```

Defaults to: by hour, from 1 day ago, to now
Defaults to: by minute, from 30 minutes ago, to now

It is important to remember the following conversions when performing queries:

- 1 day = 24 hours
- 1 hour = 60 minutes
- 1 day = 60 * 24 = 1,440 minutes

When changing the sampling rate via the `by` parameter you can accidentally ask for very large data sets if you have defined `to` and `from` parameters. We will not process exceedingly large queries. Please refer to the Response Format section below for more details.

**Param: region**

The Stats API also allows you to limit the scope of your query by restricting it to a particular region. This is achieved via the use of the `region` parameter. Currently the following regions are supported:

- `usa` - Restricts the query to statistics reported by POPs in the continental United States
- `europe` - Restricts the query to statistics reported by POPs in Europe
- `anzac` - Restricts the query to statistics reported by POPs in Australia and New Zealand
- `asia` - Restricts the query to statistics reported by POPs in Asia
- `asia_india` - Restricts the query to statistics reported by POPs in India
- `latam` - Restricts the query to statistics reported by POPs in Brazil
- `south_africa` - Restricts the query to statistics reported by POPs in southern Africa
- `southamerica_std` - Restricts the query to statistics reported by POPs in South America

Usage is exceedingly simple, let’s look at some examples:

- `/stats` Returns stats for all regions
- `/stats?region=usa` Returns stats for only US POPs
- `/stats?region=Europe` Returns stats for European POPs only

The following endpoint provides a complete list of all available regions:

GET /stats/regions

See the API section below for example output

**Response Format**

To make it easier to understand how a query is being processed we use a specific JSON response format. Here is an example:

```
/Stats?from=1+day+ago
```

```
{
  "status": "success",
  "meta": {
    "to": "Thu May 16 20:08:35 UTC 2013",
    "from": "Wed May 15 20:08:35 UTC 2013",
    "by": "day",
    "region": "all"
  },
  "msg": null
}
```
Each of the fields denotes the following:

- **status** - Whether or not we were able to successfully execute the query
- **meta** - Meta information about the scope of the query in a human readable format
- **msg** - If the query was not successful this will provide a string that explains why
- **data** - This contains the actual results of the query that we processed

Content-Type: application/json

```
GET `/stats/usage_by_month`

Returns month-to-date usage details for a given month and year. Usage details are aggregated by service and across all Fastly services, and then grouped by region.

This endpoint does not use the `from` or `to` fields for selecting the date for which data is requested. Instead, it uses `month` and `year` integer fields. Both fields are optional and default to the current month and year respectively. When set, an optional `billable_units` field will convert bandwidth to GB and divide requests by 10,000.

**Authentication**

API token.

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>month</td>
<td>integer</td>
<td>2-digit month.</td>
</tr>
<tr>
<td>year</td>
<td>integer</td>
<td>4-digit year.</td>
</tr>
<tr>
<td>billable_units</td>
<td>string</td>
<td>If 'true', return results as billable units.</td>
</tr>
</tbody>
</table>

**Real-time analytics**

**Real-time Analytics**

Fastly provides an HTTPS endpoint to poll for real-time analytics.

**Endpoint**

The base endpoint for the real-time analytics system is [https://rt.fastly.com](https://rt.fastly.com). All URLs are relative to that endpoint. All requests must be sent over HTTPS.

**Authentication**

To authenticate, use a `Fastly-Key` header containing your API token.

**Channels**

A channel ID is equivalent to a service ID, so each channel will provide real-time analytics for one service. The provided service ID must be owned by the account specified by the API token used for authentication.

There is a special channel ID demo which is used for the analytics on the [fastly.com](https://fastly.com) homepage.

**URL structure**

For regular real-time analytics, this call allows you to get (and potentially wait for) any messages after a given timestamp. A message covers a one second interval:

```
<endpoint>/v1/channel/<service id>/ts/<timestamp in seconds>
```

For the first request, the timestamp can be 0. The response will then return a new timestamp field which should be used for the next request.

There is also "History" call for fetching data from the previous 120 seconds up to the latest timestamp for a channel:

```
<endpoint>/v1/channel/<service id>/ts/h
```

This can be modified by fetching the last N entries:

```
<endpoint>/v1/channel/<service id>/ts/h/limit/<N>
```
Response structure
The response is a JSON object. The top level object has two keys: `Timestamp` and `Data`. The `Timestamp` value should be extracted and used for the next API call, e.g.:

1. Set `Timestamp` to 0
2. Make API call
3. Set `Timestamp` to Timestamp value of returned JSON object
4. Do something with the rest of the data
5. Goto #2

The `Data` value is a JSON array. For regular real-time analytics calls, it will only have one or two items. For the history call, it will have as many items as were requested.

```json
{
  "Timestamp": 1467915558,
  "Data": [ ... ]
}
```

Each item is a JSON object with two keys: `recorded` is a Unix time stamp (e.g., seconds since Jan 1st, 1970) of when this data was generated on our cache servers, and `datacenter` with another JSON object as a value.

```json
"Data": [
  {
    "recorded": 1467915558,
    "datacenter": {...}
  }, ...
]
```

The keys of the `datacenter` JSON object are the names of each of our POPs around the world plus a special key, called `aggregated`, which adds all the values from all the POPs together.

```json
"Data": {
  "datacenter": {
    "AMS": { ... },
    "SIN": { ... },
    "SJC": { ... },
    ...
  },
  "aggregated": { },
  "recorded": 1478140705
},
"Timestamp": 1478140713
```

The value of each of the POP keys is another JSON object that has various statistics. For example, here are the statistics for our San Jose POP during that time:

```json
"SJC": {
  "requests": 45,
  "resp_header_bytes": 22018,
  "resp_body_bytes": 134564,
  "hits": 200,
  "miss": 48,
  "synth": 4,
  "errors": 5,
  "hits_time": 200,
  "miss_time": 1000,
  "miss_histogram": {
    "80": 33,
    "90": 1,
    "110": 1,
    "170": 1,
    "250": 1,
    "300": 2,
    "400": 1,
    "650": 2,
    "750": 1,
    "1000": 1,
    "1100": 1
  }
}
```
The keys are the same as those mentioned on the Historical Stats page, but they show some statistics that have occurred since the last request, including the following:

- Number of requests
- Number of bytes transmitted in headers
- Number of bytes transmitted in bodies
- Number of hits
- Number of misses
- Number of synthetic responses
- Number of errors
- Amount of time spent delivering hits
- Amount of time spent delivering misses

The `miss_histogram` object is a JSON object. The keys are time buckets in 10s of milliseconds, and the values are the number of requests to origin. In this example provided above, 33 requests went to origin that took between 80 and 89 milliseconds to fetch.

The `miss_histogram` tops out at 60s. Any origin request that takes more than 60 seconds to return will be in the 60000 bucket.

**Rate limiting**

The real-time analytics API is rate limited internally. However, it is also cached behind Fastly with an expiration time of 1s. Under normal use there should be no reason for customers to hit that rate limit.

**Remote Logging**

**S3**

Fastly will upload log messages to the S3 bucket in the format specified in the S3 object.

### Amazon S3 Canary logging endpoint

Our Amazon S3 Canary logging endpoint was retired in 2019. The [Amazon S3](https://docs.aws.amazon.com/s3/latest/userguide/) logging endpoint offers the same functionality.
Syslog legacy paths

Our original syslog logging endpoints did not include /logging/ as part of the URL pattern. In 2017 we updated the URLs to match the URL pattern of our newer logging endpoints. We maintain the deprecated patterns (without /logging/) as a courtesy.

Transport Layer Security

Transport Layer Security (TLS)

Fastly offers an API for uploading and managing your keys and certificates used to enable TLS for your domains on Fastly.

To start, you must generate a new key and certificate with your preferred certification authority. You may then use our endpoints to upload a key and then upload the matching certificate. To terminate TLS for a specific domain, you’ll need to enable that domain for a given certificate by creating a protocol policy. Finally, for Fastly to begin to terminate TLS you will need to update the DNS records for the domain with the provided DNS Names returned to you.

We also provide a way for you to replace your certificates when they are nearing expiration. When regenerating a new certificate, you must ensure the list of SAN entries match the existing certificate. You can then replace the existing certificate with the new certificate.

This API also allows you to delete keys and certificates, list TLS domains for an uploaded certificate, and disable a protocol policy (which will disable TLS termination for that domain).

Private Keys

A private key is used to sign a Certificate. A key can be used to sign multiple certificates.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>created_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the private key was created. Read Only.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>A customizable name for your private key. Optional.</td>
</tr>
<tr>
<td>key</td>
<td>string</td>
<td>The contents of the private key. Must be a PEM-formatted key. Not returned in response body. Required.</td>
</tr>
<tr>
<td>key_length</td>
<td>integer</td>
<td>The key length used to generate the private key. Read Only.</td>
</tr>
<tr>
<td>key_type</td>
<td>string</td>
<td>The algorithm used to generate the private key. Must be RSA. Read Only.</td>
</tr>
<tr>
<td>replace</td>
<td>boolean</td>
<td>A recommendation from Fastly to replace this private key and all associated certificates. Read Only.</td>
</tr>
<tr>
<td>public_key_sha1</td>
<td>string</td>
<td>Useful for safely identifying the key. Read Only.</td>
</tr>
</tbody>
</table>

Actions

GET /tls/private_keys

List all TLS private keys.

Authentication

API token with at least TLS management permissions.

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter[in_use]</td>
<td>string</td>
<td>Limit the returned keys to those without any matching TLS certificates. The only valid value is false.</td>

<tr>
<td>page[number]</td>
<td>integer</td>
<td>The page index for pagination.</td>
</tr>
<tr>
<td>page[size]</td>
<td>integer</td>
<td>The number of keys per page.</td>
</tr>
</tbody>
</table>

Request Example

GET /tls/private_keys HTTP/1.1
Accept: application/vnd.api+json
Fastly-Key: YOUR_FASTLY_TOKEN
GET /tls/private_keys/<id>

Show a TLS private key.

Authentication

**API token** with at least **TLS management permissions**.

Request Example

```
GET /tls/private_keys/:id HTTP/1.1
Accept: application/vnd.api+json
Fastly-Key: YOUR_FASTLY_TOKEN
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/vnd.api+json

    }
  },
  "meta": { "record_count": 1, "current_page": 1, "per_page": 20, "total_pages": 1 }
}
```

POST /tls/private_keys

Create a TLS private key.

Authentication

**API token** with at least **TLS management permissions**.

Request Example

```
POST /tls/private_keys HTTP/1.1
Accept: application/vnd.api+json
Content-Type: application/vnd.api+json
Fastly-Key: YOUR_FASTLY_TOKEN
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/vnd.api+json

      "replace": false,
      "public_key_sha1": "KEY_DIGEST"
    }
  }
}
DELETE /tls/private_keys/ id

Destroy a TLS private key. Only private keys not already matched to any certificates can be deleted.

Authentication
API token with at least TLS management permissions.

Request Example
DELETE /tls/private_keys/:id HTTP/1.1
Accept: application/vnd.api+json
Fastly-Key: YOUR_FASTLY_TOKEN

Response Example
HTTP/1.1 204 No Content

TLS Certificates

A TLS certificate is used to terminate TLS traffic for one or more of your TLS domains.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cert_blob</td>
<td>string</td>
<td>The PEM-formatted certificate blob. Required. Write Only.</td>

</tr>
<tr>
<td>issued_to</td>
<td>string</td>
<td>The hostname for which a certificate was issued. Read Only.</td>
</tr>
<tr>
<td>issuer</td>
<td>string</td>
<td>The certificate authority that issued the certificate. Read Only.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>A customizable name for your certificate. Defaults to the certificate's common name or first Subject Alternative Names (SAN) entry. Optional.</td>
</tr>
<tr>
<td>not_after</td>
<td>string</td>
<td>Time-stamp (GMT) when the certificate will expire. Must be in the future to be used to terminate TLS traffic. Read Only.</td>
</tr>
<tr>
<td>not_before</td>
<td>string</td>
<td>Time-stamp (GMT) when the certificate will become valid. Must be in the past to be used to terminate TLS traffic. Read Only.</td>
</tr>
</tbody>
</table>
### field | type | description
--- | --- | ---
replace | boolean | A recommendation from Fastly indicating the key associated with this certificate is in need of rotation. Read Only.
serial_number | string | A value assigned by the issuer that is unique to a certificate. Read Only.
signature_algorithm | string | The algorithm used to sign the certificate. Read Only.
updated_at | string | Time-stamp (GMT) when the certificate was last updated. Read Only.
tls_domains | array | All the domains (including wildcard domains) that are listed in any certificate’s Subject Alternative Names (SAN) list.

### Actions

**GET /tls/certificates**

### PATCH /tls/certificates/id

Replace a TLS certificate with a newly reissued TLS certificate, or update a TLS certificate’s name. If replacing a TLS certificate, the new TLS certificate must contain all SAN entries as the current TLS certificate. It must either have an exact matching list or contain a superset.

**Authentication**

API token with at least TLS management permissions.

**Request Example**

```plaintext
PATCH /tls/certificates/:id HTTP/1.1
Accept: application/vnd.api+json
Content-Type: application/vnd.api+json
Fastly-Key: YOUR_FASTLY_TOKEN

{}
DELETE /tls/certificates/ id

Destroy a TLS certificate. TLS certificates already enabled for a domain cannot be destroyed.

Authentication

API token with at least TLS management permissions.

Request Example

DELETE /tls/certificates/:id HTTP/1.1
Accept: application/vnd.api+json
Fastly-Key: YOUR_FASTLY_TOKEN

Response Example

HTTP/1.1 204 No Content

TLS Domains

TLS domains are all the domains (including wildcard domains) included in any TLS certificate’s Subject Alternative Names (SAN) list. Included in the response is information about which certificates reference this domain as well as the TLS activation indicating which certificate is enabled to serve TLS traffic for the domain.

Fields

POST /tls/activations

Enable TLS for a particular TLS domain and certificate combination. These relationships must be specified to create the TLS activation.

Authentication
API token with at least TLS management permissions.

Request Example

```
POST /tls/activations HTTP/1.1
Accept: application/vnd.api+json
Content-Type: application/vnd.api+json
Fastly-Key: YOUR_FASTLY_TOKEN
```
PATCH /tls/activations/:id

Update the certificate used to terminate TLS traffic for the domain associated with this TLS activation.

Authentication
API token with at least TLS management permissions.

Request Example

```plaintext
PATCH /tls/activations/:id HTTP/1.1
Accept: application/vnd.api+json
Content-Type: application/vnd.api+json
Fastly-Key: YOUR_FASTLY_TOKEN

Content-Type: application/vnd.api+json
```
DELETE /tls/activations/ id

Disable TLS on the domain associated with this TLS activation.

Authentication
API token with at least TLS management permissions.

Request Example
DELETE /tls/activations/:id
HTTP/1.1
Accept: application/vnd.api+json
Fastly-Key: YOUR_FASTLY_TOKEN

Response Example
HTTP/1.1 204 No Content

TLS Configurations
Customers with access to multiple sets of IP pools are able to apply different configuration options to their TLS enabled domains.

DNS Records

DNS records are the available DNS addresses that can be used to enable TLS for a domain. DNS must be configured for a domain for TLS handshakes to succeed. If enabling TLS on an apex domain (e.g., example.com) you must create four A records (or four AAAA records for IPv6 support) using the displayed global A record’s IP addresses with your DNS provider. For subdomains and wildcard domains (e.g., www.example.com or *.example.com) you will need to create a relevant CNAME record.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>string</td>
<td>The IP address or hostname of the DNS record.</td>
</tr>
<tr>
<td>region</td>
<td>string</td>
<td>Specifies the regions that will be used to route traffic. Select DNS Records with a global region to route traffic to the most performant point of presence (POP) worldwide (global pricing will apply). Select DNS records with a us-eu region to exclusively land traffic on North American and European POPs.</td>
</tr>
<tr>
<td>record_type</td>
<td>string</td>
<td>The type of the DNS record. A specifies an IPv4 address to be used for an A record to be used for apex domains (e.g., example.com). AAAA specifies an IPv6 address for use in an A record for apex domains. CNAME specifies the hostname to be used for a CNAME record for subdomains or wildcard domains (e.g., <a href="http://www.example.com">www.example.com</a> or *.example.com).</td>
</tr>
</tbody>
</table>
Fastly-managed TLS subscriptions

Fastly offers an API for enabling TLS using certificates that are generated and managed by Fastly. Optionally, customers with access to multiple sets of IPs can apply different TLS configuration options to these TLS enabled domains.

TLS Subscriptions

The TLS subscriptions API allows you to programmatically generate and renew TLS certificates. Once a subscription is created for a given hostname or wildcard domain, DNS records are checked to ensure that the domain on the subscription is owned by the subscription creator. Provided DNS records are maintained, TLS certificates will automatically renew.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>certificate_authority</td>
<td>string</td>
<td>The entity that issues and certifies the TLS certificates for your subscription. Valid value is lets-encrypt.</td>
</tr>
<tr>
<td>created_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the subscription was created. Read Only.</td>
</tr>
<tr>
<td>state</td>
<td>string</td>
<td>The current state of your subscription. The list of possible states are: pending, processing, issued, and renewing. Read Only.</td>
</tr>
<tr>
<td>updated_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the subscription was last updated. Read Only.</td>
</tr>
</tbody>
</table>

Actions

GET /tls/subscriptions

List all TLS subscriptions.

Authentication

API token with at least TLS management permissions.

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include</td>
<td>string</td>
<td>Include related objects. Optional, comma-separated values. Permitted values: tls_authorizations.</td>

<tr>
<td>page[number]</td>
<td>integer</td>
<td>The page index for pagination.</td>
</tr>
<tr>
<td>page[size]</td>
<td>integer</td>
<td>The number of subscriptions per page.</td>
</tr>
</tbody>

Request Example

GET /tls/subscriptions HTTP/1.1
Accept: application/vnd.api+json
Fastly-Key: YOUR_FASTLY_TOKEN

Response Example

HTTP/1.1 200 OK
Content-Type: application/vnd.api+json
GET /tls/subscriptions/id

### GET /tls/private_keys/ id

**Description**

Show a TLS private key.

**Authentication**

[API token](#) with at least TLS management permissions.

**Request Example**

```
GET /tls/private_keys/:id HTTP/1.1
Accept: application/vnd.api+json

### POST /tls/private_keys

**Description**

Create a TLS private key.

**Authentication**

[API token](#) with at least TLS management permissions.

**Request Example**

```
POST /tls/private_keys
```
DELETE /tls/private_keys/:id

Destroy a TLS private key. Only private keys not already matched to any certificates can be deleted.

**Authentication**

*API token* with at least *TLS management permissions*.

**Request Example**

```
DELETE /tls/private_keys/:id HTTP/1.1
Accept: application/vnd.api+json
Fastly-Key: YOUR_FASTLY_TOKEN
```

**Response Example**

```
HTTP/1.1 204 No Content
```

**Bulk Certificates**

Available to Platform TLS customers, these endpoints streamline the upload, deployment and management of large numbers of TLS certificates. A certificate is used to terminate TLS traffic for one or more of your fully qualified domain names (domains). Uploading a new certificate automatically enables TLS for all domains listed as Subject Alternative Names (SAN entries) on the certificate.

**Fields**

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cert_blob</td>
<td>string</td>
<td>The PEM-formatted certificate blob. Required. Write Only.</td>

<td>Time-stamp (GMT) when the certificate was created. Read Only.</td>
</tr>
<tr>
<td>intermediates_blob</td>
<td>string</td>
<td>The PEM-formatted chain of intermediate blobs. Required. Write Only.</td>
</tr>
<tr>
<td>not_after</td>
<td>string</td>
<td>Time-stamp (GMT) when the certificate will expire. Must be in the future to be used to terminate TLS traffic. Read Only.</td>
</tr>
</tbody>
</table>
### Field Descriptions

```
GET /tls/bulk/certificates/:id

Retrieve a single certificate.

Authentication

API token with at least TLS management permissions.

Request Example

```
GET /tls/bulk/certificates/:id HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/vnd.api+json
```

Response Example

```
HTTP/1.1 200 OK

PATCH /tls/bulk/certificates/ id

Replace a certificate with a newly reissued certificate. By using this endpoint, the original certificate will cease to be used for future TLS handshakes. Thus, only SAN entries that appear in the replacement certificate will become TLS enabled. Any SAN entries that are missing in the replacement certificate will become disabled.

Authentication

API token with at least TLS management permissions.

Request Example

```

```

```
DELETE /tls/bulk/certificates/:id

Destroy a certificate. This disables TLS for all domains listed as SAN entries.

Authentication
API token with at least TLS management permissions.

Request Example
DELETE /tls/bulk/certificates/CERTIFICATE_ID HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/vnd.api+json

Response Example
HTTP/1.1 204 No Content

Limitations and conditions
The Platform TLS Certificate Deployment Service has the following general limitations:

- This service is not available for private CDN deployments.
- To take advantage of this service, you must procure your own certificates from the certification authority (CA) of your choice. Fastly will not procure certificates on your behalf.
In addition, certificates are deployed using the Platform TLS Certificate Service with the following conditions:

- Certificates hosted using SNI will only be served to browsers that support SNI. Browsers that do not support SNI will not receive the correct certificate for the domain requested.
- The certificate deployment process takes an average of approximately 20 minutes to complete once a certificate is submitted, but may take as long as an hour.
- Fastly will automatically choose the certificate delivered for a given request based on the host requested.
- The certificate with the most specific hostname will be prioritized over certificates with less specific hostnames. For example, on a request for `api.example.com`, Fastly will prioritize a certificate with a SAN entry for `api.example.com` over a different certificate with a SAN entry for `*.example.com`.
- If an identical hostname appears on more than one certificate, then the most recently uploaded certificate will be used. We recommend that you manage certificates such that hostnames remain unique for them.

**Utilities**

**Content**

Fastly makes it possible to see which version of a particular URL is cached on each edge server.

**Actions**

GET `/content/edge_check`

Retrieve headers and MD5 hash of the content for a particular URL from each Fastly edge server. This API is limited to 200 requests per hour.

**Authentication**

API token of a user with at least Engineer permissions. This endpoint does not accept a token with the global:read scope.

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>string</td>
<td>Full URL (host and path) to check on all nodes. If protocol is omitted, http will be assumed</td>
</tr>
</tbody>
</table>

**Request Example**

```plaintext
GET /content/edge_check?url=www.example.com/foo/bar HTTP/1.1
Accept: application/json
```

**Response Example**

```plaintext
HTTP/1.1 200 OK
Content-Type: application/json
```
Datacenter

List Fastly datacenters and their locations.

### Actions

**GET** /datacenters

Get a list of all Fastly datacenters.

### Authentication

**API token**

### Request Example

```plaintext
GET /datacenters HTTP/1.1
```

### Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json
```

Docs

Documentation of the endpoints that return the Fastly API Documentation.

Actions

GET /docs

Gets all documentation associated with the Fastly API.

Authentication

None.

Request Example

GET /docs HTTP/1.1

Response Example

A backend is an address (IP or domain) from which Fastly pulls content. There can be multiple backends for a service.

**Fields**

- **address** `String`. An hostname, IPv4, or IPv6 address for the backend.
- **auto_loadbalance** `Boolean`. Whether or not this backend should be automatically load balanced.
- **between_bytes_timeout** `Integer`. How long to wait between bytes in milliseconds.
- **client_cert** `null`.
- **comment** `null`.
- **connect_timeout** `1000`.
- **first_byte_timeout** `15000`.
- **healthcheck** `null`.
- **hostname** `null`.
- **ipv4** `127.0.0.1`.
- **ipv6** `null`.
- **locked** `true`.
- **max_conn** `200`.
- **max_tls_version** `null`.
- **min_tls_version** `null`.
- **name** `backend-name`.
- **port** `80`.
- **request_condition** `null`.
- **ssl_ca_cert** `null`.
- **ssl_cert_hostname** `null`.
- **ssl_cipher** `true`.
- **ssl_client_cert** `null`.
- **ssl_client_key** `null`.
- **ssl_hostname** `null`.
- **ssl_sni_hostname** `null`.
- **use_ssl** `false`.
- **version** `1`.
- **weight** `100`.
Public IP List
To help you manage firewall rules for connections from Fastly to your origin, we provide access to the list of Fastly’s assigned IP ranges. Changes to this list will be announced in advance as an “IP address announcement” (example) along with other service announcements to our status page, which you can subscribe to.

Actions
GET /public-ip-list
List the public IP addresses for the Fastly network.

Authentication
None.

Request Example
GET /public-ip-list HTTP/1.1
Accept: application/json

Response Example
HTTP/1.1 200 OK

WAF
Web Application Firewall (WAF) Configuration Set
Fastly offers a Web Application Firewall (WAF) security product that allows you to detect malicious request traffic and log or log and block that traffic before it reaches your web application. The Fastly WAF provides rules that detect and block potential attacks. The rules are collected into a policy and deployed within your Fastly service at the edge.
**GET** /service/:service_id/version/:version/wafs

List all firewall objects for a particular service and version.

**Authentication**

API token.

**Parameters**

PATCH /wafs/:id/disable

Disable a firewall for a particular service and version. This endpoint is intended to be used in an emergency. Disabling a firewall object for a specific service and version replaces your existing WAF ruleset with an empty ruleset. While disabled, your WAF ruleset will not be applied to your origin traffic. This endpoint is only available to users assigned the role of superuser or above. This is an asynchronous action. To check on the completion of this action, use the related link returned in the response to check on the Update Status of the action.

Authentication

API token with at least superuser permissions.

PATCH  /wafs/:id/enable

Re-enable a firewall object for a particular service and version after it has been disabled. This endpoint is intended to be used in an emergency. When a firewall object is re-enabled, a newly generated WAF ruleset VCL based on the current WAF configuration is used to replace the empty ruleset. This endpoint is only available to users assigned the role of superuser or above. This is an asynchronous action. To check on the completion of this action, use the related link returned in the response to check on the Update Status of the action.

Authentication
API token with at least Superuser permissions.

Request Example

```json
PATCH /wafs/:id/enable HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Content-Type: application/vnd.api+json
Accept: application/vnd.api+json

{
  "data": {
    "id": "WAF_ID",
    "type": "waf"
  }
}
```

Response Example

```
HTTP/1.1 202 Accepted
Content-Type: application/vnd.api+json
```
GET /wafs

List all active firewall objects.

Authentication
API token.

Parameters

**Actions**

**GET** /service/:service_id/wafs/:waf_id/owasp

Get the OWASP settings object for a particular service and firewall.

**Authentication**

*API token.*

**Request Example**

```
GET /service/:service_id/wafs/:waf_id/owasp HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/vnd.api+json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/vnd.api+json
```
POST /service/:service_id/wafs/:waf_id/owasp

Create an OWASP settings object for a particular service and firewall.

Authentication

API token of a user with at least Engineer permissions.

Request Example

```plaintext

Rule sets
Retrieve the currently deployed WAF ruleset VCL and the date it was deployed.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>last_push</td>
<td>string</td>
<td>Date and time WAF ruleset VCL was last deployed.</td>
</tr>
<tr>
<td>vcl</td>
<td>string</td>
<td>The WAF ruleset VCL currently deployed.</td>
</tr>
</tbody>
</table>

Actions

GET /service/:service_id/wafs/:waf_id/ruleset

Get a WAF ruleset for a particular service and firewall object.

Authentication

API token.

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_id</td>
<td>string</td>
<td>The ID of the service.</td>
</tr>
<tr>
<td>waf_id</td>
<td>string</td>
<td>The firewall ID.</td>
</tr>
</tbody>
</table>

Request Example

GET /service/:service_id/wafs/:waf_id/ruleset HTTP/1.1
Fastly-Key: YOUR_FASTLY_TOKEN
Accept: application/vnd.api+json

Response Example

HTTP/1.1 200 OK
Content-Type: application/vnd.api+json
GET /service/:service_id/wafs/:waf_id/ruleset/preview

Get a preview of the WAF ruleset VCL for a particular service and firewall object based on changes to WAF configuration before deploying the ruleset. The response will include a link to status of the background VCL generation job. Once the background job is completed, the preview WAF ruleset VCL can be retrieved from the status response.

Authentication
API token.

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_id</td>
<td>string</td>
<td>The ID of the service.</td>
</tr>
<tr>
