Fastly API Docs

API (/api/)

Config (/api/config)

(/api/#backend) Backend

A Backend is an address (ip or domain) from which Fastly pulls content. There can be multiple Backends for a Service.

Fields

- **name** - The name of the Backend.
- **address** - An IPv4, hostname, or IPv6 address for the Backend.
- **port** - The port number.
- **use_ssl** - Whether or not the use SSL to reach the backend.
- **connect_timeout** - How long to wait for a timeout in milliseconds.
- **first_byte_timeout** - How long to wait for the first bytes in milliseconds.
- **between_bytes_timeout** - How long to wait between bytes in milliseconds.
- **error_threshold** - Number of errors to allow before the backend is marked as down.
- **max_conn** - Maximum number of connections.
- **weight** - Weight used to load balance this backend against others.
- **auto_loadbalance** - Whether or not this backend should be automatically load balanced.
- **request_condition** - Condition, which if met, will select this backend during a request.
- **healthcheck** - The Name of the healthcheck to use with this backend. Can be empty.

Actions

**GET** /service/ service_id /version/ version /backend/ name

Get the backend for a particular service and version

Authentication

(api/#billing) Billing

Get information on current and past bills.

Fields

- **start_time** - The start date of this invoice.
- **end_time** - The end date of this invoice.
- **status.status** - What the current status of this invoice can be. One of Pending (being generated), Outstanding (unpaid), Paid (paid), Month to date (the current month)
- **status.sent_at** - When the invoice was sent out (if Outstanding or Paid)
- **total.plan_name** - The name of the plan this invoice was generated under.
- **total.plan_code** - The short code the plan this invoice was generated under.
- **total.plan_minimum** - The minimum cost of this plan.
- **total.bandwidth** - The total amount of bandwidth used this month in Gb.
- **total.bandwidth_cost** - The cost of the bandwidth used this month in USD.
- **total.requests** - The total number of requests used this month.
- **total.requests_cost** - The cost of the requests used this month.
- **total.in incurred_cost** - The total cost of bandwidth and requests used this month.
- **total.overage** - How much over the plan minimum has been incurred.
- **total.extras** - A list of any extras for this invoice.
- **total.extras.name** - The name of this extra cost
- **total.extras.setup** - Initial set up cost in USD (not present if $0.0 or this is not the month the extra was added).
- **total.extras.recurring** - Recurring monthly cost in USD (not present if $0.0).
- **total.extras_cost** - Total cost of all extras.
- **total.cost_before_discount** - Total incurred cost plus extras cost.
- **total.discount** - Calculated discount rate.
- **total.cost** - The final amount to be paid.
- **total.terms** - Payment terms. Almost always Net15.

Actions

Cache_settings

Controls how caching is performed on Fastly. When used in conjunction with Conditions the Cache Settings provide you with fine grain control over how long content persists in the cache.

Fields

- **name** - Name for the cache settings object
- **action** - Allows for termination of execution and either cache, pass, or restart
- **ttl** - Sets the "Time To Live"
- **stale_ttl** - Sets the max "Time To Live" for stale (unreachable) objects.
- **cache_condition** - Name of the caondition used to test whether this settings object should be used.

Actions

**GET**  `/service/ service_id /version/ version /cache_settings/ name`

Get a specific cache settings object.

Authentication

**key_or_engineer**
### GET /service/service_id/version/cache_settings

Get a list of all cache settings for a particular service and version.

#### Authentication

**key_or_engineer**

#### Parameters

#### Request Example

```bash
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/cache_settings/testcache
Fastly-Key: d3cafb4dde4dbee
Accept: application/json
```

#### Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "stale_ttl": "1000",
    "ttl": "1000",
    "action": "cache",
    "cache_condition": "",
    "name": "testcache",
    "version": "1",
    "service_id": "SU1Z0isxPaozGVKXdv0eY"
}
```

#### GET /service/service_id/version/cache_settings

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/cache_settings
Fastly-Key: d3cafb4dde4dbee
Accept: application/json

(\api{\#condition}) Condition

Conditions are used to control when and how other objects are used in a service configuration. They contain a statement that evaluates to either true or false and is used to determine whether the condition is met.

Depending on the type of the condition, the statement field can make reference to the Varnish Variables \texttt{\req}, \texttt{\resp}, and/or \texttt{\beresp}.

**Fields**

- **name** - Name of the condition.
- **statement** - The statement used to determine if the condition is met.
- **type** - Type of the condition, either "REQUEST" (\req), "RESPONSE" (\req, \resp), or "CACHE" (\req, \beresp).
- **priority** - Used to determine the priority in which conditions are checked.

**Actions**

**GET** \(\text{\service/ service_id /version/ version /condition/ name}\)

Gets the specified condition.

**Authentication**

- **key_or_engineer**

**Parameters**

**Request Example**

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/condition/testcondition
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "type":"REQUEST",

(/api/#diff) Diff

See the changes in configuration between two different versions of a service.

Fields

- **format** - the format the diff is being returned in (text, html or html_simple)
- **from** - the version number being diffed from
- **to** - the version number being diffed to
- **diff** - the differences between the two versions

Actions

**GET** /service/ service_id /diff/from/ from /to/ to

Get diff between two versions

Authentication

**key_or_engineer**

Parameters

- **from** - the version to diff from. Can either be a positive number from 1 to your maximum version or a negative number from -1 down (-1 is latest version etc)
- **to** - the version to diff to. Uses same numbering scheme as from
- **format** - optional method to format the diff field. Can either be text (default), html or html_simple

Request Example

GET /service/SU1Z0isxPaozGVKXdv0eY/diff/from/1/to/2
Fastly-Key: d3cafb4dde4dbee
Accept: application/json

Response Example

HTTP/1.1 200 OK

A Director is responsible for balancing requests among a group of Backends. In addition to simply balancing, Directors can be configured to attempt retrying failed requests. Additionally, Directors have a quorum setting which can be used to determine when the Director as a whole is considered "up", in order to prevent "server whack-a-mole" following an outage as servers come back up.

**Fields**

- **name** - Name for the Director.
- **quorum** - The percentage of capacity that needs to be up for a director to be considered up. Integer, 0 to 100 (default: 75)
- **type** - What type of load balance group to use. Integer, 1 to 4. Values: 1=random, 2=round-robin, 3=hash, 4=client. (default: 1)
- **retries** - How many backends to search if it fails. (default: 5)

**Actions**

**GET** /service/ service_id /version/ version /director/ name

Get the director for a particular service and version

**Authentication**

key_or_engineer

**Parameters**

Request Example
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/director/test-director

(/api/#director_backend) Director_backend

Maps and relates backends as belonging to directors. Backends can belong to any number of directors but directors can only hold one reference to a specific backend.

Fields
- **director** - Name of the director.
- **backend** - Name of the backend to map to the specified director.

### Actions

**GET** /service/service_id/version/director/director_name/backend/backend_name

Returns the relationship between a Backend and a Director. If the Backend has been associated with the Director, it returns a simple record indicating this. Otherwise, returns a 404.

#### Authentication

**key_or_engineer**

#### Parameters

#### Request Example

```plaintext
GET /service/6N2jxQPv1KfETea4slyvlz/version/2/director/test/backend/test HTTP/1.1
Fastly-Key: d3cafb4d5e4d3beef
Accept: application/json
```

#### Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=utf-8

{
  "service_id": "6N2jxQPv1KfETea4slyvlz",
  "version": 2,
  "director": "test",
  "backend": "test",
  "created": "2012-07-14T00:18:25+00:00",
  "updated": "2012-07-14T00:18:25+00:00",
  "deleted": null,
}
```

**POST** /service/service_id/version/director/director_name/backend/backend_name

Establishes a relationship between a Backend and a Director. The Backend is then considered a member of the Director and can be used to balance traffic onto.

#### Authentication

**key_or_engineer**

#### Parameters

#### Request Example

```plaintext
POST /service/6N2jxQPv1KfETea4slyvlz/version/2/director/test/backend/test HTTP/1.1
Fastly-Key: d3cafb4d5e4d3beef
```
DELETE /service/service_id/version/director/director_name/backend/backend_name

Deletes the relationship between a Backend and a Director. The Backend is no longer considered a member of the Director and thus will not have traffic balanced onto it from this Director.

Authentication
key_or_engineer

Parameters

Request Example

DELETE /service/6N2jxQPv1KfETea4slyv1z/version/2/director/test/backend/test HTTP/1.1

}
```

GET /docs/section/:section

Gets all documentation associated with a given Categorical Section where :section is a regular_expression. passing invert=true will force a return of everything that does not match the given regular_expression

Authentication

none

Parameters

- **invert** - boolean used get everything that does not match section

Request Example

GET /docs/section/:section
Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

[
  {

(/api/#domain) Domain

A Domain represents the domain name through which visitors will retrieve content. There can be multiple Domains for a Service.

Fields

- **name** - The domain that this service will respond to
- **comment** - A personal freeform descriptive note

Actions

```
GET /service/ service_id /version/ version /domain/ name /check
```

Checks the status of a domain's DNS record. Returns an array of 3 items. The first is the details for the domain. The second is the current CNAME of the domain. The third is a boolean indicating whether or not it has been properly setup to use Fastly.

Authentication

- **key_or_engineer**

Parameters
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/domain/www.example.com/check
Fastly-Key: d3cafb4dde4beef
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json

[ ]

GET /service/service_id/version/domain/check_all

Checks the status of all domain DNS records for a Service Version. Returns an array items in the same format as the single domain /check.

Authentication

key_or_engineer

Parameters

Request Example

GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/domain/check_all
Fastly-Key: d3cafb4dde4beef
Accept: application/json

Response Example

HTTP/1.1 200 OK

(/api/#event_log) Event_log

EventLogs keep track of things that occur within your services or organization. Currently we track events such as activation and deactivation of Versions and mass purges. In the future we intend to track more events and let you trigger EventLog creation as well.

Fields

- **object_type** - The type of object this message is for. (Ex: service, user, etc.)
- **id** - The id of the object to which this log message applies.
- **message** - A brief string explaining the event.
- **details** - A more verbose explanation of the event.
- **level** - An integer defining how serious the event is. Lower is more serious.
- **timestamp** - A unix timestamp of when the event occurred.
- **system** - Unused.
- **subsystem** - Unused.

Actions

**GET /event_log/ id**

Get the specified event log

Authentication

**key_or_engineer**

Parameters

- **limit** - raise or lower number of items returned. (default 20)
- **after** - offset response (default 0)

Request Example

```
GET /event_log/SU1Z0isxPaozGVKXdv0eY
Fastly-Key: YourAPIKey
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
```
Content-Type: application/json

```json

(/api/#header) Header

Header objects are used to add, modify, or delete headers from requests and responses. The header content can be simple strings or be derived from variables inside Varnish. Regular expressions can be used to customize the headers even further.

Fields

- **name** - A handle to refer to this Header object
- **action** -
  - 'set' - - Sets (or resets) a header
  - 'append' - - Appends to an existing header
  - 'delete' - - Delete a header
  - 'regex' - - Perform a single regex replacement on a header
  - 'regex_repeat' - - Perform a global regex replacement on a header
  - ignore_if_set - Don't add the header if it is already. (Only applies to 'set' action.)
- **type** -
  - 'request' - - Performs on the request before lookup occurs
  - 'fetch' - - Performs on the request to the origin server
  - 'cache' - - Performs on the response before it's stored in the cache
  - 'response' - - Performs on the response before delivering to the client
- **dst** - Header to set
- **src** - Variable to be used as a source for the header content (Does not apply to 'delete' action.)
- **regex** - Regular expression to use (Only applies to 'regex' and 'regex_repeat' actions.)
- **substitution** - Value to substitute in place of regular expression. (Only applies to 'regex' and 'regex_repeat'.)
- **priority** - Lower priorities execute first. (Default: 100.)
- **request_condition** - Optional name of a RequestCondition to apply.
- **cache_condition** - Optional name of a CacheCondition to apply.
- **response_condition** - Optional name of a ResponseCondition to apply.
Actions

**GET**  /service/ service_id /version/ version /header/ name

Retrieves a Header object by name.

Authentication

key_or_engineer

Parameters

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/header/testheader
Fastly-Key: d3cafb4de4d0eef

/(api/#healthcheck) Healthcheck

Healthchecks are used to customize the way Fastly checks on your Backends. Only Backends that have successful Healthchecks will be sent traffic, thus assuring that the failure of one server does not affect visitors.

Fields

- **name** - The name of the healthcheck.
- **method** - Which HTTP method to use.
- **host** - Which host to check.
- **path** - The path to check.
- **http_version** - Whether to use version 1.0 or 1.1 HTTP.
- **timeout** - Timeout in milliseconds.
- **check_interval** - How often to run the healthcheck in milliseconds.
- **expected_response** - The status code expected from the host.
- **window** - The number of most recent healthcheck queries to keep for this healthcheck.
- **threshold** - How many healthchecks must succeed to be considered healthy.
- **initial** - When loading a config, the initial number of probes to be seen as OK.

### Actions

**GET** /service/ service_id /version/ version /healthcheck/ name

Get the healthcheck for a particular service and version

**Authentication**

key_or_engineer

**Parameters**

**Request Example**

```
GET /service/SU1Z0isxPaozGVXKX0eY/version/1/healthcheck/test-healthcheck
Fastly-Key: d3cafb4dde4d3eef
Accept: application/json
```

**Response Example**

(/api/#request_settings) Request_settings

Settings used to customize Fastly's request handling. When used with Conditions the Request Settings object allows you to fine tune how specific types of requests are handled.

Fields

- **name** - Name for the request settings.
- **force_miss** - Allows you to force a cache miss for the request. Replaces the item in the cache if the content is cacheable
- **force_ssl** - Forces the request use SSL (redirects a non-SSL to SSL)
- **action** - Allows you to terminate request handling and immediately perform an action. When set it can be **lookup** or **pass** (ignore the cache completely)
- **bypass_busy_wait** - Disable collapsed forwarding, so you don't wait for other objects to origin
- **max_stale_age** - How old an object is allowed to be to serve stale-if-error or statel-while-revalidate
- **hash_keys** - Comma separated list of varnish request object fields that should be in the hash key
- **xff** - X-Forwarded-For -- should be **clear**, **leave**, **append**, **append_all**, or **overwrite**
- **timer_support** - Injects the X-Timer info into the request for viewing origin fetch durations
- **geo_headers** - Injects Fastly-Geo-Country, Fastly-Geo-City, and Fastly-Geo-Region into the request headers
- **default_host** - Sets the host header
- **request_condition** - Name of condition object used to test whether or not these settings should be used.

Actions

**GET** /service/ service_id /version/ version /request_settings/ name

Gets the specified Request Settings object.
Authentication

}
```

(/api/#response_object) Response_object

Allows you to create synthetic responses that exist entirely on the varnish machine. Useful for creating error or maintenance pages that exists outside the scope of your datacenter. Best when used with Condition objects.

Fields

- **name** - Name that identifies the Response Object
- **status** - The HTTP Status Code, defaults to 200.
- **response** - The HTTP Response, defaults to "Ok"
- **content** - The content to deliver for the response object, can be empty.
- **content_type** - The MIME type of the content, can be empty.
- **request_condition** - Name of the condition to be checked during the request phase. If the condition passes then this object will be delivered.
- **cache_condition** - Name of the condition checked after we have retrieved an object. If the condition passes then deliver this Request Object instead.
Actions

GET /service/ service_id /version/ version /response_object/ name

Gets the specified Response Object.

Authentication
key_or_engineer

(api/#stats) Stats

Stats give you information on the usage and performance of your Service. They can be request by Service and over a particular time span. Stats are broken down per datacenter, giving you information on how your Services are being used across the world. There is now a more flexible, and fully featured Stats API (/api/stats) available

Fields
- **start_time** - epoch timestamp for period request
- **end_time** - epoch timestamp for period request
- **year** - summarize a specific Y/M (requires month)
- **month** - summarize a specific month (requires year)

Actions

GET /service/service/stats/summary

Get the stats from a service for a block of time. This call requires parameters to select block of time to query. Use either a timestamp range (using **start_time** and **end_time**) or a specified month/year combo (using **month** and **year**)

Authentication

key

Parameters

Request Example

GET /service/SU1Z0isxPaozGVKXdv0eY/stats/summary?year=2013&month=7
Fastly-Key: d3cafb4dde4dbee
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json
GET /service/service/stats/type

Get the stats from a service. This call is deprecated. Please use the summary call above. If type is either of "all" or "minutely", you must use specify a block of time using the fields above

(/api/#stream) Stream

A Stream represents an incoming RTMP stream and all of its transcoded versions served over HLS, HDS or MPEG-DASH. A Stream can have renditions which control what qualities Fastly will transcode your streams into.

Fields

- **name** - The name of this stream. The name cannot be updated once set. If you wish to change the name, please delete the stream and create a new one.
- **key** - Which is used to authenticate your stream during ingress.
- **edge_url** - Where to access your streams. If no renditions exist, this will list a direct link to your source stream in each format you've enabled. If renditions exist it will link to Adaptive Bitrate Manifests for each format you've enabled.
- **encryption** - True or false value which determines whether or not your HLS stream will be encrypted using AES-128.
- **dvr_window** - Period of DVR available in seconds. Cannot exceed 86400 (1 day). 0 to disable DVR.
- **hds** - Enables or disables Adobe HTTP Dynamic Streaming (HDS). PHDS (encryption) and DVR are not yet supported.
- **dash** - Enables or disables MPEG-DASH. DASH support is experimental and the encryption and dvr_window options have no effect on it.
- **custom_service** - Normally a Fastly service is automatically provisioned for you when you create or update a stream. This option disables automatic service configuration and allows you to make manual changes to your streaming service in the Configure tab of the UI or through the API.
- **hls_segment_length** - Sets the minimum length of MPEG-TS segments. Actual segment length is dependent on the keyframe interval of your encoder. Valid values are between 0 and 18 seconds.
- **hds_segment_length** - Sets the minimum length of HDS segments. Actual segment length is dependent on the
keyframe interval of your encoder. Valid values are between 0 and 18 seconds.

- **sync_backup_ts** - By default, Fastly ingests do not modify timestamps. If enabled, our system will rewrite the timestamps of the primary and backup streams to keep them in sync. This is useful for failovers if your encoders are not sending the same timestamps.

- **sync wildcard_ts** - By default, Fastly ingests do not modify timestamps. If enabled, our system will rewrite the timestamps of all the wildcard streams to keep them in sync. This is useful if you use wildcard streams for adaptive bitrate and the timestamps are not synchronized by your encoder.

Historical Stats (/api/stats)

The Fastly Historical Stats API (i.e., the Stats API) is a RESTful API that allows Fastly customers to query historical caching stats such as number of requests, hit ratio, and number of errors. The Stats API provides an advanced querying interface that allows for fine grained time period, regional, and sampling control. This document provides a basic overview of Stats and documents all available endpoints.

Using the Stats API

The stats API is accessible from https://api.fastly.com/stats/*, and can be used with both Fastly Key and Username / Password authentication. Authentication works exactly as it does for the Core Fastly API, please refer to Authentication Documentation (/api#Auth) for further details. Here is an example using the command-line tool CURL:

```
curl -H "Fastly-Key: YOUR_API_KEY" https://api.fastly.com/stats/usage
```

To find your API key please visit the "Account" section in the Fastly Application. Your organization's API key should be displayed at the top left of the page under the heading "API Key". If the API key does not appear, then you may not be authorized to view the key and you should ask the person within your organization that setup the Fastly account. If all else fails you can contact support (http://www.fastly.com/support/) and ask to receive your API key.

Query Options (Time Range, Sampling Rate, and Regions)

There are four query parameters that you can use to specify what information is returned by the stats API. The from and to parameters control the window over which you want to fetch stats information. The by controls the sampling rate (day, hour, or minute). And the region parameter allows you to restrict the result set to a particular region.

Param: from and to

The from and to parameters are exact times that control the window over which to fetch historical statistics. By default you can use UNIX timestamps when specifying these parameters, but many forms of human readable inputs are also available, such as:

- Yesterday
- Two weeks ago
- 2/20/2013

Date parsing is performed using the Chronic ruby library; for the most detailed information on exactly what formats are available please visit the gem's GitHub page (https://github.com/mojombo/chronic). Let's see some examples:

```
/stats?from=10+days+ago
```

Returns stats for each of your services, by day, for the last ten days

```
/stats?from=10+days+ago
```

Stats from Tuesday 14th May 2013 @ 20:29:37pm UTC to Thursday 16th May 2013 @ 20:29:37pm UTC

/stats?from=1%2F1%2F2013&to=2%2F1%2F2013

Daily stats from January 1st, 2013 (1/1/2013) to February 1st, 2013

It is important to note that the from parameter is "inclusive" and the to parameter is "exclusive". This means that we will return only rows with recorded times that match the following inequality:

from <= recorded < to

NOTE: We store historical stats information using UTC, and not local time zones. This means that we will use the UTC interpretations of your inputs when querying stats information.

Param: by

The by parameter allows you to control the sampling rate used to produce the result set from querying the Stats API. There are three values that can be set:

- minute - Stats will be sampled by minute for each recorded minute in the specified window
- hour - Sample by hour within the specified window
- day - Sample by day within the specified window

If you do not provide a by parameter in your query it will default to 'day'. Each sampling rate also specifies default to and from parameters if you omit them:

Each value for the by parameter has associated defaults for the to and from parameters if they are omitted, here's an overview:

/stats

Defaults to: By day, from 1 month ago, to now

/stats?by=hour

Defaults to: by hour, from 1 day ago, to now

/stats?by=minute

Defaults to: by minute, from 30 minutes ago, to now

It is important to remember the following conversions when performing queries:
- 1 day = 24 hours
- 1 hour = 60 minutes
- 1 day = 60 * 24 = 1,440 minutes

When changing the sampling rate via the `by` parameter you can accidentally ask for very large data sets if you have defined `to` and `from` parameters. We will not process exceedingly large queries. Please refer to the Response Format section below for more details.

**Param:** `region`

The Stats API also allows you to limit the scope of your query by restricting it to a particular region. This is achieved via the use of the `region` parameter. Currently the following regions are supported:

- **usa** - Restricts the query to statistics reported by continental United States POPs (Points of Presence)
- **europe** - Restricts the query to statistics reported by European POPs
- **anzac** - Restricts the query to Australia / New Zealand / Asia / Pacific POPs

Usage is exceedingly simple, let's look at some examples:

```
/stats

Returns stats for all regions
```

```
/stats?region=usa

Returns stats for only US POPs
```

```
/stats?region=europe

Returns stats for European POPs only
```

The list of regions will always contain the ones listed above but may grow as Fastly expands into new parts of the globe. Because the list is dynamic, please use the following endpoint to get a list of all available regions:

```
/stats/regions
```

It is important to note that not all regions are available to all customers at this time. If you need support for a particular region please feel free to contact us via our helpdesk (http://www.fastly.com/support/).

**Stats Fields**
We collect many different stats fields when processing your requests. Some of the stats endpoints detailed below allow you to specify particular fields. These are the major fields we support:

- **requests** - Number of requests processed,
- **hits** - Number of cache hits,
- **hits_time** - Amount of time spent processing cache hits (in ms)
- **miss** - Number of cache misses,
- **miss_time** - Amount of time spent processing cache misses (in ms)
- **pass** - Number of requests that passed through the CDN without being cached,
- **errors** -
  - **hit_ratio** - Ratio of cache hits to cache misses (between 0 and 1)
- **bandwidth** - Bandwidth send (in bytes),
- **body_size** - Request body bandwidth sent (in bytes),
- **header_size** - Request header bandwidth sent (in bytes)

The following fields may or may not be available depending on the nature of your services:

- **uncacheable** - Number of requests that were denoted uncachable.
- **pipe** - Pipe operations performed, these operations are no longer available and are only present on legacy services.

We also provide specialized HTTP response code tally fields:

- **status_200** - Number of responses sent with status code 200 (Success),
- **status_204** - 204 (No Content)
- **status_301** - 301 (Moved Permanently),
- **status_302** - 302 (Found),
- **status_304** - 304 (Not Modified),
- **status_503** - 503 (Service Unavailable),
- **status_1xx** - Number of "Informational" category status codes returned,
- **status_2xx** - "Success" status codes returned,
- **status_3xx** - "Redirection" codes sent,
- **status_4xx** - "Client Error" codes sent,
- **status_5xx** - "Server Error" codes send

For more information on HTTP status code meanings, please refer to "List of HTTP status codes" @ Wikipedia (http://en.wikipedia.org/wiki/List_of_HTTP_status_codes). Important Note: that we have added various fields over time. If you are a long time fastly user some of the fields you request may not be accurate.

### Response Format

To make it easier to understand how a query is being processed we use a specific JSON response format. Here is an example:

```json
{  "status": "success",  "meta": { "to": "Thu May 16 20:08:35 UTC 2013",  "from": "Wed May 15 20:08:35 UTC 2013",  "by": "day",  "region": "all" },  "msg": null,  "data": [ ... ] }
```
Each of the fields denotes the following:

- **status** - Whether or not we were able to successfully execute the query
- **meta** - Meta information about the scope of the query in a human readable format
- **msg** - If the query was not successful this will provide a string that explains why
- **data** - This contains the actual results of the query that we processed

### Availability of Data

The collection and processing of statistics information from a globally distributed CDN, such as Fastly, is not instantaneous. Thus there will be a notable delay as to when certain sampling range information will be up to date. Here are the general guidelines:

1. Minutely data will be delayed by roughly 10 to 15 minutes from the current time
2. Hourly data will be delayed by the same amount, and the current hour will return a partial result (because the hour has not finished but we are incrementally aggregating data)
3. Daily data works similarly to hourly data and the current day will also represent a partial result

### Rate Limiting & Abuse

Certain queries can take a good deal of time to process with the stats API. Depending on the query parameters different rate limiting is applied to a single key or username/password. All queries that would result in greater than 2800 records are not processed and will return an error. Queries over time windows that occur strictly in the past (i.e. aggregation has been completed and the values will no longer change in the database) can be queried at will. Since different sampling rates aggregate over different periods, changing the `by` parameter of your query can affect whether or not the query can be made at will. In general, requests to the Stats API are not rate-limited under the following conditions:

- `by=minute` is set and `to` is set to a time that is at least 30 minutes behind the current time
- `by=hour` is set and `to` is set to a time that is at least 1 hour and 30 minutes behind the current time
- `by=day` is set and `to` is set to a time at least 1 day behind the current time

Requests that are not exempt from rate limiting are limited based on the result size of the request. Here are the rules we use when rate limiting:

- $1440 \leq \text{result size} \leq 2800$ - 1 request / hour
- $720 \leq \text{result size} < 1440$ - 4 request / hour
- $120 \leq \text{result size} < 720$ - 30 requests / hour
- $\text{result size} < 120$ - 100 requests / hour

These limits are subject to change and will be updated as time passes. When a request is rate limited it will be clearly denoted in the `status` and `msg` fields of the response. For more information about response formats see the Response Format section above.
