EventLogs keep track of things that occur within your services or organization. Currently we track events such as activation and deactivation of Versions and mass purges. In the future we intend to track more events and let you trigger EventLog creation as well.

**Fields**

- **object_type** - The type of object this message is for. (Ex: service, user, etc.)
- **id** - The id of the object to which this log message applies.
- **message** - A brief string explaining the event.
- **details** - A more verbose explanation of the event.
- **level** - An integer defining how serious the event is. Lower is more serious.
- **timestamp** - A unix timestamp of when the event occurred.
- **system** - Unused.
- **subsystem** - Unused.

**Actions**

**GET /event_log/ id**

Get the specified event log

**Config (/api/config)**

**(/api/#backend) Backend**

A Backend is an address (ip or domain) from which Fastly pulls content. There can be multiple Backends for a Service.

Fields
- **name** - The name of the Backend.
- **address** - An IPv4, hostname, or IPv6 address for the Backend.
- **port** - The port number.
- **use_ssl** - Whether or not the use SSL to reach the backend.
- **connect_timeout** - How long to wait for a timeout in milliseconds.
- **first_byte_timeout** - How long to wait for the first bytes in milliseconds.
- **between_bytes_timeout** - How long to wait between bytes in milliseconds.
- **error_threshold** - Number of errors to allow before the backend is marked as down.
- **max_conn** - Maximum number of connections.
- **weight** - Weight used to load balance this backend against others.
- **auto_loadbalance** - Whether or not this backend should be automatically load balanced.
- **request_condition** - Condition, which if met, will select this backend during a request.
- **healthcheck** - The Name of the healthcheck to use with this backend. Can be empty.

**Actions**

**GET** /service/ service_id /version/ version /backend/ name

Controls how caching is performed on Fastly. When used in conjunction with Conditions the Cache Settings provide you with fine grain control over how long content persists in the cache.

Fields

- **name** - Name for the cache settings object
- **action** - Allows for termination of execution and either cache, pass, or restart
- **ttl** - Sets the "Time To Live"
- **stale_ttl** - Sets the max "Time To Live" for stale (unreachable) objects.
- **cache_condition** - Name of the condition used to test whether this settings object should be used.

Actions

GET /service/ service_id /version/ version /cache_settings/ name

Get a specific cache settings object.

Authentication

key_or_engineer

Parameters

Request Example

```
GET /service/SU1Z0isxPaozGVXdv0eY/version/1/cache_settings/testcache
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
   "stale_ttl":"1000",
   "ttl":"1000",
   "action":"cache",
   "cache_condition":"

-/api/#condition) Condition

Conditions are used to control when and how other objects are used in a service configuration. They contain a statement that evaluates to either true or false and is used to determine whether the condition is met.
Depending on the type of the condition, the statement field can make reference to the Varnish Variables `req`, `resp`, and/or `beresp`.

### Fields

- **name** - Name of the condition.
- **statement** - The statement used to determine if the condition is met.
- **type** - Type of the condition, either "REQUEST" (req), "RESPONSE" (req, resp), or "CACHE" (req, beresp).
- **priority** - Used to determine the priority in which conditions are checked.

### Actions

**GET** /service/*service_id*/version/*version*/condition/*name**

Gets the specified condition.

Authentication

*key_or_engineer*

Parameters

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/condition/testcondition
Fastly-Key: d3cafb4dde4dbbeef
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "type":"REQUEST",
    "comment":"
    "name":"testcondition",
    "version":"1",
    "service_id":"SU1Z0isxPaozGVKXdv0eY",
    "statement":"req.url~ "index.html"",
    "priority":10
}
```

**GET** /service/*service_id*/version/*version*/condition

Gets all conditions for a particular service and version.

Authentication

*key_or_engineer*

Parameters

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/condition
Fastly-Key: d3cafb4dde4dbbeef
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
```
POST /service/service_id/version/version/condition

Creates a new condition.

Authentication

  "name": "testcondition",
  "version": "1",
  "service_id": "SU1Z0isxPaozGVKXdv0eY",
  "statement": "req.url ~ "index.html"",
  "priority": "10"
}

DELETE /service/service_id/version/version/condition/name

Deletes the specified condition.

Authentication

key_or_engineer

Parameters
Request Example

DELETE /service/SU1Z0isxPaozGVKXdv0eY/version/1/condition/testcondition
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json

```json
{
  "status":"ok"
}
```

**PUT /service/service_id/version/version/condition/old_name**

Updates the specified condition.

**Authentication**

**key_or_engineer**

**Parameters**

**Request Example**

PUT /service/SU1Z0isxPaozGVKXdv0eY/version/1/condition/testcondition
Fastly-Key: d3cafb4dde4dbeef
Content-Type: application/x-www-form-urlencoded
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json

```json
{
  "type":"REQUEST",
  "comment":"",
  "name":"testcondition",
  "version":"1",
  "service_id":"SU1Z0isxPaozGVKXdv0eY",

}
```

(/api/#content) Content

Fastly makes it possible to see which version of a particular url is cached on each edge server.

**Fields**

**Actions**

**GET**
/content/edge_check

Retrieve headers and MD5 hash of the content for a particular url from each Fastly edge server

Authentication
none

Parameters

- **url** - full URL (host and path) to check on all nodes. If protocol is omitted, `http` will be assumed

Request Example

```
GET /content/edge_check?url=www.mysite.com/foo/bar
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

(/api/#diff) Diff

See the changes in configuration between two different versions of a service.

Fields

- **format** - the format the diff is being returned in (text, html or html_simple)
- **from** - the version number being diffed from
- **to** - the version number being diffed to
- **diff** - the differences between the two versions

Actions
GET /service/service_id/diff/from/to

Get diff between two versions

Authentication

key_or_engineer

Parameters

- **from** - the version to diff from. Can either be a positive number from 1 to your maximum version or a negative number from -1 down (-1 is latest version etc)
- **to** - the version to diff to. Uses same numbering scheme as from
- **format** - optional method to format the diff field. Can either be text (default), html or html_simple

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/diff/from/1/to/2
Fastly-Key: d3cafb4dde4dbef
Accept: application/json
```

Response Example

(/api/#director) Director

A Director is responsible for balancing requests among a group of Backends. In addition to simply balancing, Directors can be configured to attempt retrying failed requests. Additionally, Directors have a quorum setting which can be used to determine when the Director as a whole is considered "up", in order to prevent "server whack-a-mole" following an outage as servers come back up.

Fields

- **name** - Name for the Director.
- **quorum** - The percentage of capacity that needs to be up for a director to be considered up. Integer, 0 to 100 (default: 75)
- **type** - What type of load balance group to use. Integer, 1 to 4. Values: 1=random, 2=round-robin, 3=hash, 4=client.
(default: 1)

- **retries** - How many backends to search if it fails. (default: 5)

**Actions**

**GET /service/service_id/version/director**

Get the director for a particular service and version

Authentication

**key_or_engineer**

Parameters

Request Example

```plaintext
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/director/test-director
Fastly-Key: d3cafb4dde4dbee
Accept: application/json
```

Response Example

```plaintext

(/api/#director_backend) Director_backend

Maps and relates backends as belonging to directors. Backends can belong to any number of directors but directors can only hold one reference to a specific backend.

Fields

- director - Name of the director.
- backend - Name of the backend to map to the specified director.

Actions

GET /service/ service_id /version/ version /director/ director_name /backend/ backend_name

Returns the relationship between a Backend and a Director. If the Backend has been associated with the Director, it returns a simple record indicating this. Otherwise, returns a 404.

Authentication

key_or_engineer

Parameters

Request Example
Establishes a relationship between a Backend and a Director. The Backend is then considered a member of the Director and can be used to balance traffic onto.

Authentication

key_or_engineer

Parameters

Request Example

POST /service/6N2jxQPv1KfETea4s1yvlz/version/2/director/test/backend/test HTTP/1.1
Fastly-Key: d3cafb4dde4d0eef
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json;charset=utf-8

```json
{
  "service_id": "6N2jxQPv1KfETea4s1yvlz",
  "version": 2,
  "director": "test",
  "backend": "test",
  "created": "2012-07-14T00:18:25+00:00",
  "updated": "2012-07-14T00:18:25+00:00",
  "deleted": null,
}
```
Deletes the relationship between a Backend and a Director. The Backend is no longer considered a member of the Director and thus will not have traffic balanced onto it from this Director.

Authentication

key_or_engineer

Parameters

Request Example

```
DELETE /service/6N2jxQPv1KfETeA4slyv1z/version/2/director/test/backend/test HTTP/1.1
Fastly-Key: d3cafb4dde4dbee
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json; charset=utf-8

{
  "status": "ok"
}
```

(/api/#docs) Docs

Documentation of the endpoints that return the Fastly API Documentation.

Fields

Actions

GET /docs

Gets all documentation associated with the Fastly API.

Authentication

none

Parameters

Request Example

```
GET /docs
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

[
  {
    "description": [ "An array of strings describing the endpoint",

                ... ],
    "section": "Categorical_section",
    "actions": [ }
GET /docs/subject/ endpoint

Gets all documentation relating to a given 'Subject'

Authentication

none

Parameters

Request Example

GET /docs/subject/:subject

Response Example

HTTP/1.1 200 OK
Content-Type: application/json

{  
  "description": [  
    "An array of strings describing the endpoint",

      "request": ...,  
      "response": ...,  
      "response_body": ...,  
    }  
  ]
}
Gets all documentation associated with a given Categorical Section where :section is a regular_expression. passing invert=true will force a return of everything that does not match the given regular_expression

Authentication

none

Parameters

- **invert** - boolean used get everything that does not match section

Request Example

```
GET /docs/section/:section
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

[

(/api/#domain) Domain

A Domain represents the domain name through which visitors will retrieve content. There can be multiple Domains for a Service.

Fields

- **name** - The domain that this service will respond to
- **comment** - A personal freeform descriptive note

Actions

```
GET /service/ service_id /version/ version /domain/ name /check
```

Checks the status of a domain's DNS record. Returns an array of 3 items. The first is the details for the domain. The second is the current CNAME of the domain. The third is a boolean indicating whether or not it has been properly setup to use Fastly.
GET /service/SU1Z0isxPaozGVXdv0eY/version/1/domain/www.example.com/check
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json

[ {
   "name": "www.example.com",
   "comment": "",
   "service_id": "SU1Z0isxPaozGVXdv0eY",
   "version": "1",
   "locked": true
},
   "global.prod.fastly.net.",
   true
}]

GET /service/service_id/version/version/domain/check_all

Checks the status of all domain DNS records for a Service Version. Returns an array items in the same format as the single domain /check.

Authentication
key_or_engineer

Parameters

Request Example

GET /service/SU1Z0isxPaozGVXdv0eY/version/1/domain/check_all
Fastly-Key: d3cafb4dde4dbeef

(/api/#header) Header

Header objects are used to add, modify, or delete headers from requests and responses. The header content can be simple strings or be derived from variables inside Varnish. Regular expressions can be used to customize the headers even further.

Fields

- **name** - A handle to refer to this Header object
- **action** -
  - 'set' - Sets (or resets) a header
  - 'append' - Appends to an existing header
  - 'delete' - Delete a header
  - 'regex' - Perform a single regex replacement on a header
  - 'regex_repeat' - Perform a global regex replacement on a header
- **ignore_if_set** - Don't add the header if it is already. (Only applies to 'set' action.)
- **type** -
'request' - Performs on the request before lookup occurs
'fetch' - Performs on the request to the origin server
'cache' - Performs on the response before it's stored in the cache
'response' - Performs on the response before delivering to the client

dst - Header to set
src - Variable to be used as a source for the header content (Does not apply to 'delete' action.)
regex - Regular expression to use (Only applies to 'regex' and 'regex_repeat' actions.)
substitution - Value to substitute in place of regular expression. (Only applies to 'regex' and 'regex_repeat'.)
priority - Lower priorities execute first. (Default: 100.)
request_condition - Optional name of a RequestCondition to apply.
cache_condition - Optional name of a CacheCondition to apply.
response_condition - Optional name of a ResponseCondition to apply.

Actions

GET /service/service_id/version/version/header/name

Retrieves a Header object by name.

Settings used to customize Fastly’s request handling. When used with Conditions the Request Settings object allows you to fine tune how specific types of requests are handled.

### Fields

- **name** - Name for the request settings.
- **force_miss** - Allows you to force a cache miss for the request. Replaces the item in the cache if the content is cacheable.
- **force_ssl** - Forces the request use SSL (redirects a non-SSL to SSL).
- **action** - Allows you to terminate request handling and immediately perform an action. When set it can be `lookup` or `pass` (ignore the cache completely).
- **bypass_busy_wait** - Disable collapsed forwarding, so you don't wait for other objects to origin.
- **max_stale_age** - How old an object is allowed to be to serve stale-if-error or stale-while-revalidate.
- **hash_keys** - Comma separated list of varnish request object fields that should be in the hash key.
- **xff** - `X-Forwarded-For` should be `clear, leave, append, append_all, or overwrite`.
- **timer_support** - Injects the X-Timer info into the request for viewing origin fetch durations.
- **geo_headers** - Injects Fastly-Geo-Country, Fastly-Geo-City, and Fastly-Geo-Region into the request headers.
- **default_host** - Sets the host header.
- **request_condition** - Name of condition object used to test whether or not these settings should be used.

### Actions

**GET**  
/service/service_id/version/request_settings/name

Gets the specified Request Settings object.

(/api/#response_object) Response_object

Allows you to create synthetic responses that exist entirely on the varnish machine. Useful for creating error or maintainence pages that exists outside the scope of your datacenter. Best when used with Condition objects.

Fields

- **name** - Name that identifies the Response Object
- **status** - The HTTP Status Code, defaults to 200.
- **response** - The HTTP Response, defaults to "Ok"
- **content** - The content to deliver for the response object, can be empty.
- **content_type** - The MIME type of the content, can be empty.
- **request_condition** - Name of the condition to be checked during the request phase. If the condition passes then this object will be delivered.
- **cache_condition** - Name of the condition checked after we have retrieved an object. If the condition passes then deliver this Request Object instead.

Actions

**GET** /service/ service_id /version /response_object/ name

Gets the specified Response Object.
GET /service/service_id/version/1/response_object

Returns all Response Objects for the specified service and version.

(/api/#stats) Stats

Stats give you information on the usage and performance of your Service. They can be request by Service and over a particular time span. Stats are broken down per datacenter, giving you information on how your Services are being used across the world. There is now a more flexible, and fully featured Stats API (/api/stats) available

Fields

- **start_time** - epoch timestamp for period request
- **end_time** - epoch timestamp for period request
- **year** - summarize a specific Y/M (requires month)
- **month** - summarize a specific month (requires year)

Actions

**GET /service/ service /stats/summary**

Get the stats from a service for a block of time. This call requires parameters to select block of time to query. Use either a timestamp range (using **start_time** and **end_time**) or a specified month/year combo (using **month** and **year**)

Authentication

key

Parameters

Request Example

```
GET /service/SU1Z0isxPaozGVXdv0eY/stats/summary?year=2013&month=7
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json
```

Response Example
GET /service/ service /stats/ type

Get the stats from a service. This call is deprecated. Please use the summary call above. If type is either of "all" or "minutely", you must use specify a block of time using the fields above

Authentication
key

Parameters

- **type** - granularity of stats requested. one of: all, minutely, hourly, daily

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/stats/daily

Historical Stats (/api/stats)
The Fastly Historical Stats API (i.e., the Stats API) is a RESTful API that allows Fastly customers to query historical caching stats such as number of requests, hit ratio, and number of errors. The Stats API provides an advanced querying interface that allows for fine grained time period, regional, and sampling control. This document provides a basic overview of Stats and documents all available endpoints.

Using the Stats API

The stats API is accessible from https://api.fastly.com/stats/*, and can be used with both Fastly Key and Username / Password authentication. Authentication works exactly as it does for the Core Fastly API, please refer to Authentication Documentation (/api#Auth) for further details. Here is an example using the command-line tool CURL:

```bash
curl -H "Fastly-Key: YOUR_API_KEY" https://api.fastly.com/stats/usage
```

To find your API key please visit the "Account" section in the Fastly Application. Your organization's API key should be displayed at the top left of the page under the heading "API Key". If the API key does not appear, then you may not be authorized to view the key and you should ask the person within your organization that setup the Fastly account. If all else fails you can contact support (http://www.fastly.com/support/) and ask to receive your API key.

Query Options (Time Range, Sampling Rate, and Regions)

There are four query parameters that you can use to specify what information is returned by the stats API. The from and to parameters control the window over which you want to fetch stats information. The by controls the sampling rate (day, hour, or minute). And the region parameter allows you to restrict the result set to a particular region.

Param: from and to

The from and to parameters are exact times that control the window over which to fetch historical statistics. By default you can use UNIX timestamps when specifying these parameters, but many forms of human readable inputs are also available, such as:

- Yesterday
- Two weeks ago
- 2/20/2013

Date parsing is performed using the Chronic ruby library; for the most detailed information on exactly what formats are available please visit the gem's GitHub page (https://github.com/mojombo/chronic). Let's see some examples:

```
/stats?from=10+days+ago
```

Returns stats for each of your services, by day, for the last ten days

```
/stats?from=10+days+ago
```

Stats from Tuesday 14th May 2013 @ 20:29:37pm UTC to Thursday 16th May 2013 @ 20:29:37pm UTC

```
/stats?from=1%2F1%2F2013&to=2%2F1%2F2013
```

Daily stats from January 1st, 2013 (1/1/2013) to February 1st, 2013

It is important to note that the from parameter is "inclusive" and the to parameter is "exclusive". This means that we will return only rows with recorded times that match the following inequality:

from <= recorded < to
NOTE: We store historical stats information using UTC, and not local time zones. This means that we will use the UTC interpretations of your inputs when querying stats information.

**Param: **by

The `by` parameter allows you to control the sampling rate used to produce the result set from querying the Stats API. There are three values that can be set:

- **minute** - Stats will be sampled by minute for each recorded minute in the specified window
- **hour** - Sample by hour within the specified window
- **day** - Sample by day within the specified window

If you do not provide a `by` parameter in your query it will default to 'day'. Each sampling rate also specifies default `to` and `from` parameters if you omit them:

Each value for the `by` parameter has associated defaults for the `to` and `from` parameters if they are omitted, here's an overview:

<table>
<thead>
<tr>
<th>URL</th>
<th>Default Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>/stats</td>
<td>By day, from 1 month ago, to now</td>
</tr>
<tr>
<td>/stats?by=hour</td>
<td>By hour, from 1 day ago, to now</td>
</tr>
<tr>
<td>/stats?by=minute</td>
<td>By minute, from 30 minutes ago, to now</td>
</tr>
</tbody>
</table>

It is important to remember the following conversions when performing queries:

- 1 day = 24 hours
- 1 hour = 60 minutes
- 1 day = 60 * 24 = 1,440 minutes

When changing the sampling rate via the `by` parameter you can accidentally ask for very large data sets if you have defined `to` and `from` parameters. We will not process exceedingly large queries. Please refer to the Response Format section below for more details.

**Param: **region

The Stats API also allows you to limit the scope of your query by restricting it to a particular region. This is achieved via the use of the `region` parameter. Currently the following regions are supported:

- **usa** - Restricts the query to statistics reported by continental United States POPs (Points of Presence)
- **europe** - Restricts the query to statistics reported by European POPs
- **anzac** - Restricts the query to Australia / New Zealand / Asia / Pacific POPs

Usage is exceedingly simple, let's look at some examples:

<table>
<thead>
<tr>
<th>URL</th>
<th>Usage Scenario</th>
</tr>
</thead>
<tbody>
<tr>
<td>/stats</td>
<td>/stats?region=usa</td>
</tr>
</tbody>
</table>
Returns stats for all regions

/stats?region=usa

Returns stats for only US POPs

/stats?region=europa

Returns stats for European POPs only

The list of regions will always contain the ones listed above but may grow as Fastly expands into new parts of the globe. Because the list is dynamic, please use the following endpoint to get a list of all available regions:

/stats/regions

It is important to note that not all regions are available to all customers at this time. If you need support for a particular region please feel free to contact us via our helpdesk (http://www.fastly.com/support/).

Stats Fields

We collect many different stats fields when processing your requests. Some of the stats endpoints detailed below allow you to specify particular fields. These are the major fields we support:

- **requests** - Number of requests processed,
- **hits** - Number of cache hits,
- **hits_time** - Amount of time spent processing cache hits (in ms)
- **miss** - Number of cache misses,
- **miss_time** - Amount of time spent processing cache misses (in ms)
- **pass** - Number of requests that passed through the CDN without being cached,
- **errors** -
  - **hit_ratio** - Ratio of cache hits to cache misses (between 0 and 1)
  - **bandwidth** - Bandwidth send (in bytes),
  - **body_size** - Request body bandwidth sent (in bytes),
  - **header_size** - Request header bandwidth sent (in bytes)

The following fields may or may not be available depending on the nature of your services:

- **uncacheable** - Number of requests that were denoted uncachable.
- **pipe** - Pipe operations performed, these operations are no longer available and are only present on legacy services.

We also provide specialized HTTP response code tally fields:

- **status_200** - Number of responses sent with status code 200 (Success),
- **status_204** - 204 (No Content)
- **status_301** - 301 (Moved Permanently),
- **status_302** - 302 (Found),
- **status_304** - 304 (Not Modified),
- **status_503** - 503 (Service Unavailable),
- **status_1xx** - Number of "Informational" category status codes returned,
- **status_2xx** - "Success" status codes returned,
- **status_3xx** - "Redirection" codes sent,
- **status_4xx** - "Client Error" codes sent,
- **status_5xx** - "Server Error" codes send

For more information on HTTP status code meanings, please refer to "List of HTTP status codes" @ Wikipedia (http://en.wikipedia.org/wiki/List_of_HTTP_status_codes). Important Note: that we have added various fields over time. If you are a long time fastly user some of the fields you request may not be accurate.

### Response Format

To make it easier to understand how a query is being processed we use a specific JSON response format. Here is an example:

```json
{
  "status": "success",
  "meta": {
    "to": "Thu May 16 20:08:35 UTC 2013",
    "from": "Wed May 15 20:08:35 UTC 2013",
    "by": "day",
    "region": "all"
  },
  "msg": null,
  "data": [ ... ]
}
```

Each of the fields denotes the following:

- **status** - Whether or not we were able to successfully execute the query
- **meta** - Meta information about the scope of the query in a human readable format
- **msg** - If the query was not successful this will provide a string that explains why
- **data** - This contains the actual results of the query that we processed

### Availability of Data

The collection and processing of statistics information from a globally distributed CDN, such as Fastly, is not instantaneous. Thus there will be a notable delay as to when certain sampling range information will be up to date. Here are the general guidelines:

1. Minutely data will be delayed by roughly 10 to 15 minutes from the current time
2. Hourly data will be delayed by the same amount, and the current hour will return a partial result (because the hour has not finished but we are incrementally aggregating data)
3. Daily data works similarly to hourly data and the current day will also represent a partial result

### Rate Limiting & Abuse

Certain queries can take a good deal of time to process with the stats API. Depending on the query parameters different rate limiting is applied to a single key or username/password. All queries that would result in greater than 2800 records are not processed and will return an error. Queries over time windows that occur strictly in the past (i.e. aggregation has been completed and the values will no longer change in the database) can be queried at will. Since different sampling rates aggregate over different periods, changing the **by** parameter of your query can affect whether or not the query can be made at will. In general, requests to the Stats API are not rate-limited under the following conditions:

- **by=minute** is set and **to** is set to a time that is at least 30 minutes behind the current time
- **by=hour** is set and **to** is set to a time that is at least 1 hour and 30 minutes behind the current time
- **by=day** is set and **to** is set to a time at least 1 day behind the current time

Requests that are not exempt from rate limiting are limited based on the result size of the request. Here are the rules we use when rate limiting:

- $1440 \leq \text{result size} \leq 2800 \rightarrow 1 \text{ request / hour}$
• 720 <= result size < 1440 - 4 request / hour
• 120 <= result size < 720 - 30 requests / hour
• result size < 120 - 100 requests / hour

These limits are subject to change and will be updated as time passes. When a request is rate limited it will be clearly denoted in the `status` and `msg` fields of the response. For more information about response formats see the Response Format section above.

**API Reference**

**GET** /stats

Fetches historical stats for each of your fastly services and groups the results by service id.

Request Example

```
GET /stats?from=1+day+ago
Fastly-Key: d3cafb4dde4dbee
Accept: application/json
```

Remote Logging (/api/logging)

(/api/#logging_ftp) FTP

Fastly will upload log messages periodically to the server, and in the format, specified in the FTP object.

Fields

- **name** - The name of the ftp rule.
- **address** - An IPv4 or hostname address.
- **port** - The port number.
- **user** - The username for the server (can be anonymous).
- **password** - The password for the server (for anonymous use an email address).
- **directory** - The directory to upload log files to.
- **period** - How frequently the logs should be dumped (in seconds, default 3600).
- **gzip_level** - What level of GZIP encoding to have when dumping logs (default 0, no compression).
- **format** - Apache style log formatting.
- **response_condition** - When to execute the ftp. If empty, always execute.

Actions

**GET** /service/ service_id /version/ version /logging/ftp/ name

Get the FTP for a particular service and version

Authentication

none

Parameters

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/logging/ftp/test-ftp
Fastly-Key: d3cafb4dde4d4beef
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "name": "test-ftp",
    "service_id": "SU1Z0isxPaozGVKXdv0eY",
    "version": "1",
    "address": "example.com",
    "hostname": "example.com",
    "port": "21",
}
```
GET `/service/service_id/version/logging/ftp`

List all of the FTPs for a particular service and version

Authentication

none

Parameters

Request Example

```bash
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/logging/ftp
Fastly-Key: d3cafb4dde4dbee
Accept: application/json
```

Response Example

```json

```

POST `/service/service_id/version/logging/ftp`

Create a FTP for a particular service and version

Authentication

none

Parameters

Request Example
POST /service/SU1Z0isxPaozGVKXdv0eY/version/1/logging/ftp
   Fastly-Key: d3cafb4dde4dbeef
   Content-Type: application/x-www-form-urlencoded
   Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json
