Event Log

EventLogs keep track of things that occur within your services or organization. Currently we track events such as activation and deactivation of Versions and mass purges. In the future we intend to track more events and let you trigger EventLog creation as well.

Fields

- object_type The type of object this message is for. (Ex: service, user, etc.)
- id The id of the object to which this log message applies.
- message A brief string explaining the event.
- details A more verbose explanation of the event.

- **level** An integer defining how serious the event is. Lower is more serious.
- **timestamp** A unix timestamp of when the event occurred.
- **system** Unused.
- subsystem Unused.

Actions

```
GET /event log/ id
```

Get the specified event log

Config (/api/config)

Backend

A Backend is an address (ip or domain) from which Fastly pulls content. There can be multiple Backends for a Service.

Fields

- name The name of the Backend.
- address An IPv4, hostname, or IPv6 address for the Backend.

- port The port number.
- use ssl Whether or not the use SSL to reach the backend.
- connect_timeout How long to wait for a timeout in milliseconds.
- **first_byte_timeout** How long to wait for the first bytes in milliseconds.
- between_bytes_timeout How long to wait between bytes in milliseconds.
- error threshold Number of errors to allow before the backend is marked as down.
- max_conn Maximum number of connections.
- weight Weight used to load balance this backend against others.
- auto_loadbalance Whether or not this backend should be automatically load balanced.
- request_condition Condition, which if met, will select this backend during a request.
- healthcheck The Name of the healthcheck to use with this backend. Can be empty.

Actions

GET /service/ service_id /version/ version /backend/ name

Get the backend for a particular service and version

Authentication

key or engineer

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/backend/test-backend
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json
```

Cache Settings

Controls how caching is performed on Fastly. When used in conjunction with Conditions the Cache Settings provide you with fine grain control over how long content persists in the cache.

Fields

- name Name for the cache settings object
- action Allows for termination of execution and either cache, pass, or restart
- ttl Sets the "Time To Live"
- **stale_ttl** Sets the max "Time To Live" for stale (unreachable) objects.
- cache_condition Name of the caondition used to test whether this settings object should be used.

Actions

GET /service/ service_id /version/ version /cache settings/ name

Get a specific cache settings object.

Authentication

key or engineer

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/cache_settings/testcache Fastly-Key: d3cafb4dde4dbeef Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "stale_ttl":"1000",
    "ttl":"1000",
    "action":"cache",
    "cache_condition":"",
    "name":"testcache",
    "version":"1",
    "service_id":"SU1Z0isxPaozGVKXdv0eY"
}
```

GET /service/ service_id /version/ version /cache settings

Get a list of all cache settings for a particular service and version.

Authentication

key or engineer

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/cache_settings
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json
```

POST /service/ service_id /version/ version /cache_settings

Create a new cache settings object.

Authentication

key_or_engineer

Request Example

```
POST /service/SU1Z0isxPaozGVKXdv0eY/version/1/cache_settings
Fastly-Key: d3cafb4dde4dbeef
Content-Type: application/x-www-form-urlencoded
Accept: application/json

name=testcache&stale_ttl=1000&ttl=1000&action=cache

    "name":"testcache",
    "version":"1",
    "service_id":"SU1Z0isxPaozGVKXdv0eY"
}
```

DELETE /service/ service_id /version/ version /cache settings/ name

Delete a specific cache settings object.

Authentication

key_or_engineer

```
DELETE /service/SU1Z0isxPaozGVKXdv0eY/version/1/backend/check_all Fastly-Key: d3cafb4dde4dbeef Accept: application/json
```

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "status":"ok"
}
```

PUT /service/ service_id /version/ version /cache_settings/ old_name

Update a specific cache settings object.

Authentication

key_or_engineer

Request Example

```
PUT /service/SU1Z0isxPaozGVKXdv0eY/version/1/cache_settings/testcache
Fastly-Key: d3cafb4dde4dbeef
Content-Type: application/x-www-form-urlencoded
Accept: application/json

stale_ttl=2000&ttl=1000
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "stale_ttl":"2000",
    "ttl":"1000",
    "action":"cache",
    "cache_condition":"",
    "name":"testcache",
    "version":"1",
    "service_id":"SU1Z0isxPaozGVKXdv0eY"
}
```

Condition

Conditions are used to control when and how other objects are used in a service configuration. They contain a statement that evaluates to either true or false and is used to determine whether the condition is met.

Depending on the type of the condition, the statment field can make reference to the Varnish Variables req, resp, and/or beresp.

Fields

- name Name of the condition.
- **statement** The statement used to determine if the condition is met.
- **type** Type of the condition, either "REQUEST" (req), "RESPONSE" (req, resp), or "CACHE" (req, beresp).
- priority Used to determine the priority in which conditions are checked.

Actions

GET /service/ service_id /version/ version /condition/ name

Gets the specified condition.

Authentication

key_or_engineer

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/condition/testcondition
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json
```

Response Example

"priority":"10"

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "type":"REQUEST",
    "comment":"",
    "name":"testcondition",
    "version":"1",
    "service_id":"SU1Z0isxPaozGVKXdv0eY",
    "statement":"req.url~ \"index.html\"",
```

GET /service/ service_id /version/ version /condition

Gets all conditions for a particular service and version.

}

Authentication

}
```

DELETE /service/ service_id /version/ version /condition/ name

Deletes the specified condition.

Authentication

key_or_engineer

Request Example

```
DELETE /service/SU1Z0isxPaozGVKXdv0eY/version/1/condition/testcondition
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "status":"ok"
}
```

PUT /service/ service_id /version/ version /condition/ old_name

Updates the specified condition.

Authentication

key_or_engineer

```
PUT /service/SU1Z0isxPaozGVKXdv0eY/version/1/condition/testcondition
Fastly-Key: d3cafb4dde4dbeef

Diff

See the changes in configuration between two different versions of a service.

Fields

- format the format the diff is being returned in (text, html or html_simple)
- from the version number being diffed from
- to the version number being diffed to
- diff the differences between the two versions

Actions

GET /service/ service id /diff/from/ from /to/ to

Get diff between two versions

Authentication

key_or_engineer

Parameters

- **from** the version to diff from. Can either be a positive number from 1 to your maximum version or a negative number from -1 down (-1 is latest version etc)
- to the version to diff to. Uses same numbering scheme as from
- format optional method to format the diff field. Can either be text (default), html or html_simple

Director

A Director is responsible for balancing requests among a group of Backends. In addition to simply balancing, Directors can be configured to attempt retrying failed requests. Additionally, Directors have a quorum setting which can be used to determine when the Director as a whole is considered "up", in order to prevent "server whack-a-mole" following an outage as servers come back up.

Fields

- name Name for the Director.
- quorum The percentage of capacity that needs to be up for a director to be considered up. Integer, 0 to 100 (default: 75)
- **type** What type of load balance group to use. Integer, 1 to 4. Values: 1=random, 2=round-robin, 3=hash, 4=client. (default: 1)
- retries How many backends to search if it fails. (default: 5)

Actions

GET /service/ service_id /version/ version /director/ name

Get the director for a particular service and version

Authentication

key_or_engineer

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/director/test-director
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "name": "test-director",
    "service_id": "SU1Z0isxPaozGVKXdv0eY",
    "version": "1"
    "type": "1",
    "retries": "5",
    "quorum": "75",
}
```

GET /service/ service_id /version/ version /director

List the directors for a particular service and version

Authentication

key_or_engineer

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/director
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json
```

```
HTTP/1.1 200 OK
Content-Type: application/json

[

    "retries": "5",
    "quorum": "75",
```

}

POST /service/ service_id /version/ version /director

Create a director for a particular service and version

Authentication

key or engineer

Request Example

```
POST /service/SU1Z0isxPaozGVKXdv0eY/version/1/director
Fastly-Key: d3cafb4dde4dbeef
Content-Type: application/x-www-form-urlencoded
Accept: application/json

name=test-director
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "name": "test-director",
    "service_id": "SU1Z0isxPaozGVKXdv0eY",
    "version": "1"
    "type": "1",
    "retries": "5",
    "quorum": "75",
    "capacity", "100"
}
```

DELETE /service/ service_id /version/ version /director/ name

Delete the director for a particular service and version

Authentication

key or engineer

```
DELETE /service/SU1Z0isxPaozGVKXdv0eY/version/1/director/test-director
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json
```

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "status":"ok"
}
```

PUT /service/ service_id /version/ version /director/ name

Update the director for a particular service and version

Authentication

key_or_engineer

Request Example

```
PUT /service/SU1Z0isxPaozGVKXdv0eY/version/1/director/test-director
Fastly-Key: d3cafb4dde4dbeef
Content-Type: application/x-www-form-urlencoded
Accept: application/json
id=updated-director;retries=10
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json

{
    "name": "updated-director",
    "service_id": "SU1Z0isxPaozGVKXdv0eY",

    "retries": "10",
    "quorum": "75",
}
```

Director Backend

Maps and relates backends as belonging to directors. Backends can belong to any number of directors but directors can only hold one reference to a specific backend.

Fields

- director Name of the director.
- backend Name of the backend to map to the specified director.

Actions

GET /service/ service_id /version/ version /director/ director_name /backend/ backend_name

Returns the relationship between a Backend and a Director. If the Backend has been associated with the Director, it returns a simple record indicating this. Otherwise, returns a 404.

Authentication

key or engineer

Request Example

```
GET /service/6N2jxQPVlKfETea4s1yv1z/version/2/director/test/backend/test
HTTP/1.1
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json; charset=utf-8

{
    "service_id": "6N2jxQPVlKfETea4s1yv1z"
    "version": 2,
    "director": "test",
    "backend": "test",
    "created": "2012-07-14T00:18:25+00:00",
    "updated": "2012-07-14T00:18:25+00:00",
    "deleted": null,
}
```

POST /service/ service_id /version/ version /director/ director_name /backend/ backend_name

Establishes a relationship between a Backend and a Director. The Backend is then considered a member of the Director and can be used to balance traffic onto.

Authentication

key_or_engineer

Request Example

POST /service/6N2jxQPVlKfETea4s1yv1z/version/2/director/test/backend/test

}

```
HTTP/1.1
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json
```

Response Example

"deleted": null,

```
HTTP/1.1 200 OK
Content-Type: application/json; charset=utf-8

{
    "service_id": "6N2jxQPVlKfETea4s1yv1z"
    "version": 2,
    "director": "test",
    "backend": "test",
    "created": "2012-07-14T00:18:25+00:00",
```

"updated": "2012-07-14T00:18:25+00:00",

DELETE /service/ service_id /version/ version /director/ director_name /backend/ backend_name

Deletes the relationship between a Backend and a Director. The Backend is no longer considered a member of the Director and thus will not have traffic balanced onto it from this Director.

Authentication

key_or_engineer

Request Example

```
DELETE
/service/6N2jxQPVlKfETea4s1yv1z/version/2/director/test/backend/test
HTTP/1.1
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json; charset=utf-8

{
    "status": "ok"
}
```

Domain

A Domain represents the domain name through which visitors will retrieve content. There can be multiple Domains for a Service.

Fields

- name The domain that this service will respond to
- comment A personal freeform descriptive note

Actions

GET /service/ service_id /version/ version /domain/ name /check

Checks the status of a domain's DNS record. Returns an array of 3 items. The first is the details for the domain. The second is the current CNAME of the domain. The third is a boolean indicating whether or not it has been properly setup to use Fastly.

Authentication

key_or_engineer

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/domain/www.example.com/check Fastly-Key: d3cafb4dde4dbeef Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json
```

GET /service/ service_id /version/ version /domain/check all

Checks the status of all domain DNS records for a Service Version. Returns an array items in the same format as the single domain /check.

Authentication

Header

Header objects are used to add, modify, or delete headers from requests and responses. The header content can be simple strings or be derived from variables inside Varnish. Regular expressions can be used to customize the headers even further.

Fields

- name A handle to refer to this Header object
- action Accepts a string value, one of:
 - set Sets (or resets) a header
 - append Appends to an existing header
 - delete Delete a header
 - regex Perform a single regex replacement on a header
 - regex_repeat Perform a global regex replacement on a header
- **ignore_if_set** Don't add the header if it is already. (Only applies to 'set' action.)
- type Accepts a string value, one of:
 - request Performs on the request before lookup occurs
 - fetch Performs on the request to the origin server

- o cache Performs on the response before it's stored in the cache
- response Performs on the response before delivering to the client
- dst Header to set
- src Variable to be used as a source for the header content (Does not apply to 'delete' action.)
- regex Regular expression to use (Only applies to 'regex' and 'regex' repeat' actions.)
- substitution Value to substitute in place of regular expression. (Only applies to 'regex' and 'regex_repeat'.)
- priority Lower priorities execute first. (Default: 100.)
- request_condition Optional name of a RequestCondition to apply.
- cache_condition Optional name of a CacheCondition to apply.
- response_condition Optional name of a ResponseCondition to apply.

Actions

GET /service/ service_id /version/ version /header/ name

Retrieves a Header object by name.

Healthcheck

Healthchecks are used to customize the way Fastly checks on your Backends. Only Backends that have successful Healthchecks will be sent traffic, thus assuring that the failure of one server does not affect visitors.

Fields

- **name** The name of the healthcheck.
- method Which HTTP method to use.
- host Which host to check.
- path The path to check.
- http version Whether to use version 1.0 or 1.1 HTTP.
- timeout Timeout in milliseconds.
- check_interval How often to run the healthcheck in milliseconds.
- expected_response The status code expected from the host.
- window The number of most recent healthcheck queries to keep for this healthcheck.
- threshold How many healthchecks must succeed to be considered healthy.
- initial When loading a config, the initial number of probes to be seen as OK.

Actions

GET /service/ service_id /version/ version /healthcheck/ name

Get the healthcheck for a particular service and version

Request Settings

Settings used to customize Fastly's request handling. When used with Conditions the Request Settings object allows you to fine tune how specific types of requests are handled.

Fields

- name Name for the request settings.
- force_miss Allows you to force a cache miss for the request. Replaces the item in the cache if the content is cacheable
- force_ssl Forces the request use SSL (redirects a non-SSL to SSL)
- action Allows you to terminate request handling and immediately perform an action.
 When set it can be *lookup* or pass (ignore the cache completely)
- bypass_busy_wait Disable collapsed forwarding, so you don't wait for other objects to origin
- max_stale_age How old an object is allowed to be to serve stale-if-error or stalewhile-revalidate
- hash_keys Comma separated list of varnish request object fields that should be in the hash key
- xff X-Forwarded-For -- should be clear, leave, append, append_all, or overwrite
- timer_support Injects the X-Timer info into the request for viewing origin fetch durations
- **geo_headers** Injects Fastly-Geo-Country, Fastly-Geo-City, and Fastly-Geo-Region into the request headers
- default_host Sets the host header
- request_condition Name of condition object used to test whether or not these settings should be used.

Actions

GET /service/ service_id /version/ version /request settings/ name

Gets the specified Request Settings object.

Response Object

Allows you to create synthetic responses that exist entirely on the varnish machine. Useful for creating error or maintainence pages that exists outside the scope of your datacenter. Best when used with Condition objects.

Fields

- name Name that identifies the Response Object
- status The HTTP Status Code, defaults to 200.
- response The HTTP Response, defaults to "Ok"
- **content** The content to deliver for the response object, can be empty.
- content_type The MIME type of the content, can be empty.
- request_condition Name of the condition to be checked during the request phase. If the condition passes then this object will be delivered.
- cache_condition Name of the condition checked after we have retrieved an object. If the condition passes then deliver this Request Object instead.

Actions

GET /service/ service_id /version/ version /response_object/ name

Gets the specified Response Object.

Stats

Stats give you information on the usage and performance of your Service. They can be request by Service and over a particular time span. Stats are broken down per datacenter, giving you information on how your Services are being used across the world. There is now a more flexible, and fully featured Stats API (/api/stats) available

Fields

- start_time epoch timestamp for period request
- end_time epoch timestamp for period request
- year summarize a specific Y/M (requires month)
- month summarize a specific month (requires year)

Actions

GET /service/ service /stats/summary

Get the stats from a service for a block of time. This call **requires** parameters to select block of time to query. Use either a timestamp range (using **start_time** and **end_time**) or a specified month/year combo (using **month** and **year**)

Authentication

Historical Stats (/api/stats)

The Fastly Historical Stats API (i.e., the Stats API) is a RESTful API that allows Fastly customers to query historical caching stats such as number of requests, hit ratio, and number of errors. The Stats API provides an advanced querying interface that allows for fine grained time period, regional, and sampling control. This document provides a basic overview of Stats and documents all available endpoints.

Using the Stats API

The stats API is accessible from https://api.fastly.com/stats/*, and can be used with both Fastly Key and Username / Password authentication. Authentication works exactly as it does for the Core Fastly API, please refer to Authentication Documentation (/api#Auth) for further details. Here is an example using the command-line tool CURL:

```
curl -H "Fastly-Key: YOUR_API_KEY" https://api.fastly.com/stats/usage
```

To find your API key please visit the "Account" section in the Fastly Application. Your organization's API key should be displayed at the top left of the page under the heading "API Key". If the API key does not appear, then you may not be authorized to view the key and you should ask the person within your organization that setup the Fastly account. If all else fails you can contact support (http://www.fastly.com/support/) and ask to receive your API key.

Query Options (Time Range, Sampling Rate, and Regions)

There are four query parameters that you can use to specify what information is returned by the stats API. The from and to parameters control the window over which you want to fetch stats information. The by controls the sampling rate (day, hour, or minute). And the region parameter allows you to restrict the result set to a particular region.

Param: from and to

The from and to parameters are exact times that control the window over which to fetch historical statistics. By default you can use UNIX timestamps when specifying these parameters, but many forms of human readable inputs are also available, such as:

Yesterday

- Two weeks ago
- 2/20/2013

Date parsing is performed using the Chronic ruby library; for the most detailed information on exactly what formats are available please visit the gem's GitHub page (https://github.com/mojombo/chronic (https://github.com/mojombo/chronic)). Let's see some examples:

/stats?from=10+days+ago

Returns stats for each of your services, by day, for the last ten days

/stats?from=10+days+ago

Stats from Tuesday 14th May 2013 @ 20:29:37pm UTC to Thursday 16th May 2013 @ 20:29:37pm UTC

/stats?from=1%2F1%2F2013&to=2%2F1%2F2013/

Daily stats from January 1st, 2013 (1/1/2013) to February 1st, 2013

It is important to note that the from parameter is "inclusive" and the to parameter is "exclusive". This means that we will return only rows with recorded times that match the following inequality:

from <= recorded < to

NOTE: We store historical stats information using UTC, and not local time zones. This means that we will use the UTC interpretations of your inputs when querying stats information.

Param: by

The by parameter allows you to control the sampling rate used to produce the result set from querying the Stats API. There are three values that can be set:

- minute Stats will be sampled by minute for each recorded minute in the specified window
- · hour Sample by hour within the specified window

day - Sample by day within the specified window

If you do not provide a by parameter in your query it will default to 'day'. Each sampling rate also specifies default to and from parameters if you omit them:

Each value for the by parameter has associated defaults for the to and from parameters if they are omitted, here's an overview:

/stats

Defaults to: By day, from 1 month ago, to now

/stats?by=hour

Defaults to: by hour, from 1 day ago, to now

/stats?by=minute

Defaults to: by minute, from 30 minutes ago, to now

It is important to remember the following conversions when performing queries:

- 1 day = 24 hours
- 1 hour = 60 minutes
- 1 day = 60 * 24 = 1,440 minutes

When changing the sampling rate via the by parameter you can accidentally ask for very large data sets if you have defined to and from parameters. We will not process exceedingly large queries. Please refer to the Response Format section below for more details.

Param: region

The Stats API also allows you to limit the scope of your query by restricting it to a particular region. This is achieved via the use of the region parameter. Currently the following regions are supported:

- usa Restricts the query to statistics reported by continental United States POPs (Points of Presence)
- europe Restricts the guery to statistics reported by European POPs

• anzac - Restricts the query to Australia / New Zealand / Asia / Pacific POPs

Usage is exceedingly simple, let's look at some examples:

/stats

Returns stats for all regions

/stats?region=usa

Returns stats for only US POPs

/stats?region=europe

Returns stats for European POPs only

The list of regions will always contain the ones listed above but may grow as Fastly expands into new parts of the globe. Because the list is dynamic, please use the following endpoint to get a list of all available regions:

GET /stats/regions

See the API section below for example output

It is important to note that not all regions are available to all customers at this time. If you need support for a particular region please feel free to contact us via our helpdesk (http://www.fastly.com/support/).

Stats Fields

We collect many different stats fields when processing your requests. Some of the stats endpoints detailed below allow you to specify particular fields. These are the major fields we support:

- requests Number of requests processed,
- hits Number of cache hits.
- hits_time Amount of time spent processing cache hits (in ms)
- miss Number of cache misses,

- miss_time Amount of time spent processing cache misses (in ms)
- pass Number of requests that passed through the CDN without being cached,
- errors -
- hit_ratio Ratio of cache hits to cache misses (between 0 and 1)
- bandwidth Bandwidth send (in bytes),
- body_size Request body bandwidth sent (in bytes),
- header_size Request header bandwidth sent (in bytes)

The following fields may or may not be available depending on the nature of your services:

- uncacheable Number of requests that were denoted uncachable.
- pipe Pipe operations performed, these operations are no longer available and are only present on legacy services.

We also provide specialized HTTP response code tally fields:

- status_200 Number of responses sent with status code 200 (Success),
- status_204 204 (No Content)
- status_301 301 (Moved Permanently),
- status_302 302 (Found),
- status_304 304 (Not Modified),
- status_503 503 (Service Unavailable),
- status_1xx Number of "Informational" category status codes returned,
- status_2xx "Success" status codes returned,
- status_3xx "Redirection" codes sent,
- status_4xx "Client Error" codes sent,
- status 5xx "Server Error" codes send

For more information on HTTP status code meanings, please refer to "List of HTTP status codes" @ Wikipedia (http://en.wikipedia.org/wiki/List_of_HTTP_status_codes). Important Note: that we have added various fields over time. If you are a long time fastly user some of the fields you request may not be accurate.

Response Format

response format. Here is an example:

```
/stats?from=1+day+ago

{
    "status": "success",
    "meta": {
        "to": "Thu May 16 20:08:35 UTC 2013",
        "from": "Wed May 15 20:08:35 UTC 2013",
        "by": "day",
        "region": "all"
    },
    "msg": null,
    "data": [ ... ]
}
```

Each of the fields denotes the following:

- status Whether or not we were able to successfully execute the query
- meta Meta information about the scope of the query in a human readable format
- msg If the query was not successful this will provide a string that explains why
- data This contains the actual results of the guery that we processed

Availability of Data

The collection and processing of statistics information from a globally distributed CDN, such as Fastly, is not instantaneous. Thus there will be a notable delay as to when certain sampling range information will be up to date. Here are the general guidelines:

- 1. Minutely data will be delayed by roughly 10 to 15 minutes from the current time
- Hourly data will be delayed by the same amount, and the current hour will return a partial result (because the hour has not finished but we are incrementally aggregating data)
- 3. Daily data works similarly to hourly data and the current day will also represent a partial result

Rate Limiting & Abuse

Certain queries can take a good deal of time to process with the stats API. Depending on the query parameters different rate limiting is applied to a single key or username/password. All queries that would result in greater than 2800 records are not processed and will return an

error. Queries over time windows that occur strictly in the past (i.e. aggregation has been completed and the values will no longer change in the database) can be queried at will. Since different sampling rates aggregate over different periods, changing the by parameter of your query can affect whether or not the query can be made at will. In general, requests to the Stats API are not rate-limited under the following conditions:

- by=minute is set and to is set to a time that is at least 30 minutes behind the current time
- by=hour is set and to is set to a time that is at least 1 hour and 30 minutes behind the current time
- by=day is set and to is set to a time at least 1 day behind the current time

Requests that are not exempt from rate limiting are limited based on the result size of the request. Here are the rules we use when rate limiting:

- 1440 <= result size <= 2800 1 request / hour
- 720 <= result size < 1440 4 request / hour
- 120 <= result size < 720 30 reguests / hour
- result size < 120 100 requests / hour

These limits are subject to change and will be updated as time passes. When a request is rate limited it will be clearly denoted in the status and msg fields of the response. For more information about response formats see the Response Format section above.
