Event Log

EventLogs keep track of things that occur within your services or organization. Currently we track events such as activation and deactivation of Versions and mass purges. In the future we intend to track more events and let you trigger EventLog creation as well.

Fields

- **object_type** - The type of object this message is for. (Ex: service, user, etc.)
- **id** - The id of the object to which this log message applies.
- **message** - A brief string explaining the event.
- **details** - A more verbose explanation of the event.
- **level** - An integer defining how serious the event is. Lower is more serious.
- **timestamp** - A unix timestamp of when the event occurred.
- **system** - Unused.
- **subsystem** - Unused.

Actions

**GET**  `/event_log/ id`

Get the specified event log

Authentication

API key ([guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key](https://docs.fastly.com/api/aio/)) or session cookie ([api/#Auth](https://docs.fastly.com/api/aio/)) with at least **Engineer** permissions ([guides/user-access-and-control/user-roles-and-how-to-change-them](https://docs.fastly.com/api/aio/)).

Parameters

- **limit** - raise or lower number of items returned. (default 20)
- **after** - offset response (default 0)

Request Example

```plaintext
GET /event_log/SU1Z0isxPaozGVKXdv0eY

User

A User of the Fastly administration panel. A User is always associated with a Customer.

Fields

- **login** - The email address, which is the login name, of this user.
- **name** - The real life name of the user.
- **role** - The role of this user.

Actions

**POST** /current_user/password

Update the user's password to a new one

Authentication

Session cookie (/api/#Auth).

Request Example

**POST** /current_user/password/newpwd

https://docs.fastly.com/api/aio
old_password=oldpasswd&password=newpwd

Response Example

Config (/api/config)

Backend

A Backend is an address (ip or domain) from which Fastly pulls content. There can be multiple Backends for a Service.

Fields

- **name** - The name of the Backend.
- **address** - An IPv4, hostname, or IPv6 address for the Backend.
- **port** - The port number.
- **connect_timeout** - How long to wait for a timeout in milliseconds.
- **max_conn** - Maximum number of connections.
- **error_threshold** - Number of errors to allow before the backend is marked as down.
- **first_byte_timeout** - How long to wait for the first bytes in milliseconds.
- **between_bytes_timeout** - How long to wait between bytes in milliseconds.
- **auto_loadbalance** - Whether or not this backend should be automatically load balanced.
- **weight** - Weight used to load balance this backend against others.
- **request_condition** - Condition, which if met, will select this backend during a request.
- **healthcheck** - The Name of the healthcheck to use with this backend. Can be empty.
- **use_ssl** - Whether or not to use SSL to reach the backend.
- **ssl_check_cert** - Be strict on checking SSL certs.
- **ssl_hostname** - Used for both SNI during the TLS handshake and to validate the cert.
- **ssl_cert_hostname** - Overrides ssl_hostname, but only for cert verification. Does not affect SNI at all.
- **ssl_sni_hostname** - Overrides ssl_hostname, but only for SNI in the handshake. Does not affect cert validation at all.
- **min_tls_version** - minimum allowed TLS version on ssl connections to this backend
- **max_tls_version** - maximum allowed TLS version on ssl connections to this backend.
- **ssl_ciphers** - list of openssl ciphers (see https://www.openssl.org/docs/manmaster/apps/ciphers.html for details)

### Actions

**GET** /service/ service_id /version/ version /backend/ name

Get the backend for a particular service and version

Authentication

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/#Auth) with at least **Engineer** permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Request Example

```plaintext
GET /service/SU1Z0i4mPaozGVXdxv0eY/version/1/backend/test-backend
Fastly-Key: d3cafb4dde4d9eef
Accept: application/json
```

Response Example
Create a backend for a particular service and version

Authentication

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/#Auth) with at least [Engineer](/guides/user-access-and-control/user-roles-and-how-to-change-them) permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Request Example

```http

Cache Settings

Controls how caching is performed on Fastly. When used in conjunction with Conditions the Cache Settings provide you with fine grain control over how long content persists in the cache.

Fields

- **name** - Name for the cache settings object
- **action** - Allows for termination of execution and either cache, pass, or restart
- **ttl** - Sets the "Time To Live"
- **stale_ttl** - Sets the max "Time To Live" for stale (unreachable) objects.
- **cache_condition** - Name of the condition used to test whether this settings object should be used.

Actions

**GET** /service/service_id/version/version/cache_settings/name

Get a specific cache settings object.

Authentication

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/#Auth) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Request Example

```
GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/cache_settings/testcache
Fastly-Key: d3cafb4dde4dbeef
Accept: application/json
```

Response Example

```

**Condition**

Conditions are used to control when and how other objects are used in a service configuration. They contain a statement that evaluates to either true or false and is used to determine whether the condition is met.
Depending on the type of the condition, the statement field can make reference to the Varnish Variables \texttt{req}, \texttt{resp}, and/or \texttt{beresp}.

**Fields**

- **name** - Name of the condition.
- **statement** - The statement used to determine if the condition is met.
- **type** - Type of the condition, either "REQUEST" (req), "RESPONSE" (req, resp), or "CACHE" (req, beresp).
- **priority** - Used to determine the priority in which conditions are checked.

**Actions**

\texttt{GET /service/ service_id /version/ version /condition/ name}

Gets the specified condition.

**Authentication**

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/#Auth) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

**Request Example**

Dictionary

A Dictionary is a table that stores key value pairs accessible to VCL functions during VCL processing. A new dictionary is empty and attached to a working version of a service (not locked/active). In order for the dictionary to appear in generated vcl, the version associated with the dictionary must be activated. To remove a dictionary, the dictionary must be deleted on a working version (not locked/active), and that version without the dictionary then must be activated.

Fields

- **name** - Name for the Dictionary.
- **service_id** - Which Service to associate this with.
- **version** - Which version to use.

**Actions**

**GET** /service/servicel/service_id /version/ version /dictionary

List all dictionaries for the version of the service

**Authentication**

API key ([guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key](https://docs.fastly.com/api/aio)) or session cookie ([api/#Auth](https://docs.fastly.com/api/aio)) with at least [Engineer](https://docs.fastly.com/api/aio) permissions ([guides/user-access-and-control/user-roles-and-how-to-change-them](https://docs.fastly.com/api/aio)).

**Request Example**

```plaintext
GET /service/SU1Z0isxPaozGVKXdv0eY/version/4/dictionary
Fastly-Key: d3cafb4dde4d3eef
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json

  }
]
```

**GET** /service/servicel/service_id /version/ version /dictionary/ name

Retrieve a single dictionary by name for the version and service

**Authentication**

## Dictionary Item

A DictionaryItem holds a key and value that make up an entry in a Dictionary. DictionaryItems are versionless so they can be modified without activating a new version.

### Fields

- **service_id** - The service the Dictionary belongs to
- **dictionary_id** - The dictionary for this Item.
- **item_key** - Key for the DictionaryItem.
- **item_value** - Value for the DictionaryItem.

### Actions

**GET** /service/ service_id/dictionary/ dictionary_id/items

List of DictionaryItems given service and dictionary ID

Authentication

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/#Auth) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Diff

See the changes in configuration between two different versions of a service.

Fields

- **format** - the format the diff is being returned in (text, html or html_simple)
- **from** - the version number being diffed from
- **to** - the version number being diffed to
- **diff** - the differences between the two versions

**Actions**

**GET** `/service/service_id/diff/from/from/to/to`

Get diff between two versions

**Authentication**

API key (accessed through the account management page) or session cookie with at least **Engineer** permissions.

**Parameters**

- **from** - the version to diff from. Can either be a positive number from 1 to your maximum version or a negative number from -1 down (-1 is latest version etc)
- **to** - the version to diff to. Uses same numbering scheme as from
- **format** - optional method to format the diff field. Can either be text (default), html or html_simple

**Request Example**

```
GET /service/SU1Z0isxPaozGVKXdv0eY/diff/from/1/to/2

A Director is responsible for balancing requests among a group of Backends. In addition to simply balancing, Directors can be configured to attempt retrying failed requests. Additionally, Directors have a quorum setting which can be used to determine when the Director as a whole is considered "up", in order to prevent "server whack-a-mole" following an outage as servers come back up.

**Fields**

- **name** - Name for the Director.
- **quorum** - The percentage of capacity that needs to be up for a director to be considered up. Integer, 0 to 100 (default: 75)
- **type** - What type of load balance group to use. Integer, 1 to 4. Values: 1=random, 2=round-robin, 3=hash, 4=client. (default: 1)
- **retries** - How many backends to search if it fails. (default: 5)

**Actions**

**GET** `/service/ service_id /version/ version /director/ name`

Get the director for a particular service and version

**Authentication**

**Director Backend**

Maps and relates backends as belonging to directors. Backends can belong to any number of directors but directors can only hold one reference to a specific backend.

**Fields**

- **director** - Name of the director.
- **backend** - Name of the backend to map to the specified director.

**Actions**
GET /service/service_id/version/version/director/director_name/backend/backend_name

Returns the relationship between a Backend and a Director. If the Backend has been associated with the Director, it returns a simple record indicating this. Otherwise, returns a 404.

Authentication

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/#Auth) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Request Example

GET /service/6N2jxQPv1KfETea4s1yv1z/version/2/director/test/backend/test
HTTP/1.1
Fastly-Key: d3cafb4d4de4dbeeef
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json; charset=utf-8

```json
{
  "service_id": "6N2jxQPv1KfETea4s1yv1z",
  "version": 2,

  "deleted": null,
}
```

POST /service/service_id/version/version/director/director_name/backend/backend_name

Establishes a relationship between a Backend and a Director. The Backend is then considered a member of the Director and can be used to balance traffic onto.

Authentication

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/#Auth) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).
DELETE service/service_id/version/director/director_name/backend/backend_name

Deletes the relationship between a Backend and a Director. The Backend is no longer considered a member of the Director and thus will not have traffic balanced onto it from this Director.

Authentication

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/#Auth) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Request Example

DELETE /service/6N2jxQPVLkETea4s1yv1z/version/2/director/test/backend/test
HTTP/1.1
Fastly-Key: d3cafb4dde4dbeeef
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json; charset=utf-8

```json

}
```
Domain

A Domain represents the domain name through which visitors will retrieve content. There can be multiple Domains for a Service.

Fields

- **name** - The domain that this service will respond to
- **comment** - A personal freeform descriptive note

Actions

**GET**  /service/ service_id /version/ version /domain/ name /check

Checks the status of a domain's DNS record. Returns an array of 3 items. The first is the details for the domain. The second is the current CNAME of the domain. The third is a boolean indicating whether or not it has been properly setup to use Fastly.

Authentication

API key ([guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key](https://docs.fastly.com/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key)) or session cookie ([api/#Auth](https://docs.fastly.com/api/#Auth)) with at least Engineer permissions ([guides/user-access-and-control/user-roles-and-how-to-change-them](https://docs.fastly.com/guides/user-access-and-control/user-roles-and-how-to-change-them)).

Header

Header objects are used to add, modify, or delete headers from requests and responses. The header content can be simple strings or be derived from variables inside Varnish. Regular expressions can be used to customize the headers even further.

Fields

- **name** - A handle to refer to this Header object
- **action** - Accepts a string value, one of:
  - set
  - append
  - delete
- **regex**
- **regex_repeat**

- **ignore_if_set** - Don't add the header if it is already. (Only applies to 'set' action.)

- **type** - Accepts a string value, one of:
  - request
  - fetch
  - cache
  - response

- **dst** - Header to set

- **src** - Variable to be used as a source for the header content (Does not apply to 'delete' action.)

- **regex** - Regular expression to use (Only applies to 'regex' and 'regex_repeat' actions.)

- **substitution** - Value to substitute in place of regular expression. (Only applies to 'regex' and 'regex_repeat'.)

- **priority** - Lower priorities execute first. (Default: 100.)

- **request_condition** - Optional name of a RequestCondition to apply.

- **cache_condition** - Optional name of a CacheCondition to apply.

- **response_condition** - Optional name of a ResponseCondition to apply.

### Actions

**GET**  
/service/ service_id /version/ version /header/ name

Retrieves a Header object by name.

### Authentication

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/#Auth) with at least **Engineer** permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Healthcheck

Healthchecks are used to customize the way Fastly checks on your Backends. Only Backends that have successful Healthchecks will be sent traffic, thus assuring that the failure of one server does not affect visitors.

Fields

- **name** - The name of the healthcheck.
- **method** - Which HTTP method to use.
- **host** - Which host to check.
- **path** - The path to check.
- **http_version** - Whether to use version 1.0 or 1.1 HTTP.
- **timeout** - Timeout in milliseconds.
- **check_interval** - How often to run the healthcheck in milliseconds.
- **expected_response** - The status code expected from the host.
- **window** - The number of most recent healthcheck queries to keep for this healthcheck.
- **threshold** - How many healthchecks must succeed to be considered healthy.
- **initial** - When loading a config, the initial number of probes to be seen as OK.

**Actions**

Request Settings

Settings used to customize Fastly's request handling. When used with Conditions the Request Settings object allows you to fine tune how specific types of requests are handled.

Fields

- **name** - Name for the request settings.
- **force_miss** - Allows you to force a cache miss for the request. Replaces the item in the cache if the content is cacheable.
- **force_ssl** - Forces the request use SSL (redirects a non-SSL to SSL).
- **action** - Allows you to terminate request handling and immediately perform an action. When set it can be *lookup* or *pass* (ignore the cache completely).
- **bypass_busy_wait** - Disable collapsed forwarding, so you don't wait for other objects to origin.
- **max_stale_age** - How old an object is allowed to be to serve stale-if-error or stale-while-revalidate.
- **hash_keys** - Comma separated list of varnish request object fields that should be in the hash key.
- **xff** - X-Forwarded-For -- should be *clear, leave, append, append_all, or overwrite*.
- **timer_support** - Injects the X-Timer info into the request for viewing origin fetch durations.
- **geo_headers** - Injects Fastly-Geo-Country, Fastly-Geo-City, and Fastly-Geo-Region into the request headers.
- **default_host** - Sets the host header.
- **request_condition** - Name of condition object used to test whether or not these settings should be used.

Actions

Response Object

Allows you to create synthetic responses that exist entirely on the varnish machine. Useful for creating error or maintainence pages that exists outside the scope of your datacenter. Best when used with Condition objects.

Fields

- **name** - Name that identifies the Response Object
- **status** - The HTTP Status Code, defaults to 200.
- **response** - The HTTP Response, defaults to "Ok"
- **content** - The content to deliver for the response object, can be empty.
- **content_type** - The MIME type of the content, can be empty.
- **request_condition** - Name of the condition to be checked during the request phase. If the condition passes then this object will be delivered.
- **cache_condition** - Name of the condition checked after we have retrieved an object. If the condition passes then deliver this Request Object instead.

**Actions**

```plaintext
GET /service/ service_id /version/ version /response_object/ name

Service

A Service represents the configuration for a website, app, api, or anything else to be served through Fastly. A Service can have many Versions, through which Backends, Domains, and more can be configured.

Fields

- **name** - The name of this service.
• **customer_id** - Which customer this service belongs to.
• **publish_key** - What key to use for the publish streams.
• **versions** - A list of versions associated with this service.

**Actions**

**GET** /service

Stats

Stats give you information on the usage and performance of your Service. They can be request by Service and over a particular time span. Stats are broken down per datacenter, giving you information on how your Services are being used across the world. There is now a more flexible, and fully featured Stats API (/api/stats) available
Fields

- **start_time** - epoch timestamp for period request
- **end_time** - epoch timestamp for period request
- **year** - summarize a specific Y/M (requires month)
- **month** - summarize a specific month (requires year)

Actions

**GET**  
`/service/service/stats/summary`

Get the stats from a service for a block of time. This call requires parameters to select block of time to query. Use either a timestamp range (using **start_time** and **end_time**) or a specified month/year combo (using **month** and **year**)

Authentication

API key ([guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key](https://docs.fastly.com/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key)) or session cookie ([api/#Auth](https://docs.fastly.com/api/#Auth)).

Historical Stats (/api/stats)

The Fastly Historical Stats API (i.e., the Stats API) is a RESTful API that allows Fastly customers to query historical caching stats such as number of requests, hit ratio, and number of errors. The Stats API provides an advanced querying interface that allows for fine grained time period, regional, and sampling control. This document provides a basic overview of Stats and documents all available endpoints.

Using the Stats API

The stats API is accessible from https://api.fastly.com/stats/*, and can be used with both Fastly Key and Username / Password authentication. Authentication works exactly as it does for the Core Fastly API, please refer to Authentication Documentation (/api/#Auth) for further details. Here is an example using the command-line tool CURL:

curl -H "Fastly-Key: YOUR_API_KEY" https://api.fastly.com/stats/usage

To find your API key please visit the "Account" section in the Fastly Application. Your organization's API key should be displayed at the top left of the page under the heading "API Key". If the API key does not appear, then you may not be authorized to view the key and you should ask the person within your organization that setup the Fastly account. If all else fails you can contact support (https://www.fastly.com/support) and ask to receive your API key.
Query Options (Time Range, Sampling Rate, and Regions)

There are four query parameters that you can use to specify what information is returned by the stats API. The `from` and `to` parameters control the window over which you want to fetch stats information. The `by` controls the sampling rate (day, hour, or minute). And the `region` parameter allows you to restrict the result set to a particular region.

**Param: `from` and `to`**

The `from` and `to` parameters are exact times that control the window over which to fetch historical statistics. By default you can use UNIX timestamps when specifying these parameters, but many forms of human readable inputs are also available, such as:

- Yesterday
- Two weeks ago
- 2/20/2013

Date parsing is performed using the Chronic ruby library; for the most detailed information on exactly what formats are available please visit the gem's GitHub page ([https://github.com/mojombo/chronic](https://github.com/mojombo/chronic)). Let's see some examples:

```
/stats?from=10+days+ago
```

Returns stats for each of your services, by day, for the last ten days

```
/stats?from=10+days+ago
```

Stats from Tuesday 14th May 2013 @ 20:29:37pm UTC to Thursday 16th May 2013 @ 20:29:37pm UTC

```
/stats?from=1%2F2013&to=2%2F1%2F2013/
```

Daily stats from January 1st, 2013 (1/1/2013) to February 1st, 2013

It is important to note that the `from` parameter is "inclusive" and the `to` parameter is "exclusive". This means that we will return only rows with recorded times that match the following inequality:
NOTE: We store historical stats information using UTC, and not local time zones. This means that we will use the UTC interpretations of your inputs when querying stats information.

**Param: `by`**

The `by` parameter allows you to control the sampling rate used to produce the result set from querying the Stats API. There are three values that can be set:

- **minute** - Stats will be sampled by minute for each recorded minute in the specified window
- **hour** - Sample by hour within the specified window
- **day** - Sample by day within the specified window

If you do not provide a `by` parameter in your query it will default to 'day'. Each sampling rate also specifies default `to` and `from` parameters if you omit them:

Each value for the `by` parameter has associated defaults for the `to` and `from` parameters if they are omitted, here's an overview:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Default <code>by</code></th>
<th>Default <code>to</code></th>
<th>Default <code>from</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>/stats</td>
<td>By day, from 1 month ago, to now</td>
<td></td>
<td></td>
</tr>
<tr>
<td>/stats?by=hour</td>
<td>by hour, from 1 day ago, to now</td>
<td></td>
<td></td>
</tr>
<tr>
<td>/stats?by=minute</td>
<td>by minute, from 30 minutes ago, to now</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

It is important to remember the following conversions when performing queries:

- 1 day = 24 hours
- 1 hour = 60 minutes
- 1 day = 60 * 24 = 1,440 minutes
When changing the sampling rate via the `by` parameter you can accidentally ask for very large data sets if you have defined `to` and `from` parameters. We will not process exceedingly large queries. Please refer to the Response Format section below for more details.

**Param: region**

The Stats API also allows you to limit the scope of your query by restricting it to a particular region. This is achieved via the use of the `region` parameter. Currently the following regions are supported:

- **usa** - Restricts the query to statistics reported by continental United States POPs (Points of Presence)
- **europe** - Restricts the query to statistics reported by European POPs
- **anzac** - Restricts the query to Australia / New Zealand / Asia / Pacific POPs

Usage is exceedingly simple, let's look at some examples:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>/stats</code></td>
<td>Returns stats for all regions</td>
</tr>
<tr>
<td><code>/stats?region=usa</code></td>
<td>Returns stats for only US POPs</td>
</tr>
<tr>
<td><code>/stats?region=europe</code></td>
<td>Returns stats for European POPs only</td>
</tr>
</tbody>
</table>

The list of regions will always contain the ones listed above but may grow as Fastly expands into new parts of the globe. Because the list is dynamic, please use the following endpoint to get a list of all available regions:

```
GET /stats/regions
```

See the API section below for example output
It is important to note that not all regions are available to all customers at this time. If you need support for a particular region please feel free to contact us via our helpdesk (https://www.fastly.com/support).

Stats Fields

We collect many different stats fields when processing your requests. Some of the stats endpoints detailed below allow you to specify particular fields. These are the major fields we support:

- **requests** - Number of requests processed
- **hits** - Number of cache hits
- **hits_time** - Amount of time spent processing cache hits (in seconds)
- **miss** - Number of cache misses
- **miss_time** - Amount of time spent processing cache misses (in seconds)
- **pass** - Number of requests that passed through the CDN without being cached
- **errors** - Number of cache errors
- **hit_ratio** - Ratio of cache hits to cache misses (between 0 and 1)
- **bandwidth** - Total bytes delivered (body_size + header_size)
- **body_size** - Total body bytes delivered
- **header_size** - Total header bytes delivered

The following fields may or may not be available depending on the nature of your services:

- **uncacheable** - Number of requests that were denoted uncachable.
- **pipe** - Pipe operations performed, these operations are no longer available and are only present on legacy services.

We also provide specialized HTTP response code tally fields:

- **status_200** - Number of responses sent with status code 200 (Success)
- **status_204** - 204 (No Content)
- **status_301** - 301 (Moved Permanently)
- **status_302** - 302 (Found)
- **status_304** - 304 (Not Modified)
- **status_503** - 503 (Service Unavailable)
- **status_1xx** - Number of "Informational" category status codes delivered
- **status_2xx** - "Success" status codes delivered
- **status_3xx** - "Redirection" codes delivered
- **status_4xx** - "Client Error" codes delivered
- **status_5xx** - "Server Error" codes delivered

For more information on HTTP status code meanings, please refer to Wikipedia's list of HTTP status codes (https://en.wikipedia.org/wiki/List_of_HTTP_status_codes).

### Response Format

To make it easier to understand how a query is being processed we use a specific JSON response format. Here is an example:

```
/stats?from=1+day+ago
```

```
{
  "status": "success",
  "meta": {
    "to": "Thu May 16 20:08:35 UTC 2013",
    "from": "Wed May 15 20:08:35 UTC 2013",
    "by": "day",
    "region": "all"
  },
  "msg": null,
  "data": [ ... ]
}
```

Each of the fields denotes the following:

- **status** - Whether or not we were able to successfully execute the query
- **meta** - Meta information about the scope of the query in a human readable format
- **msg** - If the query was not successful this will provide a string that explains why
- **data** - This contains the actual results of the query that we processed

### Availability of Data

The collection and processing of statistics information from a globally distributed CDN, such as Fastly, is not instantaneous. Thus there will be a notable delay as to when certain sampling range information will be up to date. Here are the general guidelines:
1. Minutely data will be delayed by roughly 10 to 15 minutes from the current time
2. Hourly data will be delayed by the same amount, and the current hour will return a partial result (because the hour has not finished but we are incrementally aggregating data)
3. Daily data works similarly to hourly data and the current day will also represent a partial result

## Syslog

Fastly will stream log messages to the location, and in the format, specified in the Syslog object.

### Fields

- **name** - The name of the syslog rule.
- **address** - An IPv4, IPv6 or hostname address.
- **port** - The port number.
- **use_tls** - Whether to use TLS for secure logging.
- **tls_ca_cert** - A secure certificate to authenticate the server with.
- **token** - Whether to prepend each message with a specific token.
- **format** - Apache style log formatting.
- **response_condition** - When to execute the syslog. If empty, always execute.

### Actions

```plaintext
GET /service/service_id/version/version/syslog/name
```
Get the Syslog for a particular service and version

**Authentication**

API key ([/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key](https://docs.fastly.com/api/aio) or session cookie ([/api/#Auth](https://docs.fastly.com/api/aio)) with at least **Engineer** permissions ([/guides/user-access-and-control/user-roles-and-how-to-change-them](https://docs.fastly.com/api/aio)).

Utilities (/api/tools)

**Content**

Fastly makes it possible to see which version of a particular URL is cached on each edge server.

**Actions**

**GET** /content/edge_check

Retrieve headers and MD5 hash of the content for a particular URL from each Fastly edge server.
Authentication

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/#Auth) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Parameters

- **url** - full URL (host and path) to check on all nodes. If protocol is omitted, `http` will be assumed.

Request Example

```
GET /content/edge_check?url=www.example.com/foo/bar
Accept: application/json
```

Response Example

```
HTTP/1.1 200 OK
Content-Type: application/json
