API (\texttt{/api/})

Authentication (\texttt{/api/auth})

You authenticate to the Fastly API in one of three ways: via API tokens, API key, or a session.

API tokens

API tokens are unique authentication identifiers that you can create for the users and applications authorized to interact with your service. You can scope the authorization of tokens to a single service, and you can restrict access to \texttt{purge all} by limiting tokens to purging by URL and surrogate keys. Because users can create multiple API tokens, you can rotate tokens without taking services offline, and you can revoke individual tokens without having to update other API integrations.

\textbf{IMPORTANT:} This feature is part of a limited availability release. For more information, see our \texttt{product and feature life cycle} (\texttt{/guides/customer-support/product-and-feature-life-cycles\#limited-availability}) descriptions.

Two-factor authentication

API tokens support two-factor authentication (\texttt{/guides/account-management-and-security/enabling-and-disabling-two-factor-authentication}). Send the generated one-time password via the Fastly-OTP header when creating a token, as shown below.

\begin{verbatim}
POST https://api.fastly.com/tokens
Fastly-OTP: 123456
username=youremail@example.com&password=PASSWORD
\end{verbatim}

Availability

Currently, all endpoints that support API keys also support API tokens. In addition to checking if the user is authenticated, the API will check if the user's role (\texttt{/guides/user-access-and-control/user-roles-and-how-to-change-them}) is authorized to perform the requested action. For example, billing endpoints will require an API token issued for a billing user (or superuser).

Scopes

Scopes can be used to limit a token's access. The following scopes are currently supported:

- \textbf{api-key}: This is the default scope. Grants the same access level as conventional Fastly API keys.
- **purge**: Allows purging with surrogate-key and URL. Disallows purging with purge all.
- **purge_all**: Allows purging an entire service.

You can also scope the authorization of tokens to a single service by specifying the `service_id` in a parameter in the POST `/tokens` action.

### Expiration

You can optionally set API tokens to expire at a specified date and time. After a token expires, using it for any request will return an HTTP 401 response. Specify the expiration date by using the `expires_at` parameter in the POST `/tokens` action. Format the date and time in ISO 8601 (https://en.wikipedia.org/wiki/ISO_8601) format (e.g., `2016-07-28T19:24:50+00:00`).

### Backward compatibility

API tokens are compatible with API keys, and can be included in any API calls in the `Fastly-Key` HTTP header. The Fastly API will check the provided key against both API keys as well as API tokens. Fastly API clients can use an API token value instead of an existing API key.

### Limitations

API tokens currently have the following limitations:

- Creating, using, and deleting API tokens is currently only available via the API.
- When you generate a new token, you should store it in a safe place and keep it secret. For security reasons, you won’t be able to retrieve the token later.
- There is a limit of 100 tokens per user.
- Tokens carry the same permission model (/guides/user-access-and-control/user-roles-and-how-to-change-them) as the user. For example, if you are a billing user, then your token will only allow you to perform the capabilities of the billing role.

### API reference

An API Token is used to identify who the API call is made on behalf of. It can also be used to restrict what an app can do through authorization scope. Users can create multiple tokens to suit their needs.

#### Actions

**GET /tokens**

List all tokens belonging to the authenticated user.

**Authentication**

API token (/api/auth#tokens)

**Request Example**

```
GET /tokens
Fastly-Key: d3cafb4de4d6544f
Accept: application/json
```

**Response Example**

```
HTTP/1.1 200 OK
Content-Type: application/json

[{
   "id": "5Yo3XXnrQpjc20u0ybrf2g",
   "user_id": "4y5K5trZocEAYkesW1k7M",
   "service_id": null,
   "name": "my_token",
   "scope": "api-key",
   "created_at": "2016-06-22T03:19:48+00:00"
   "expires_at": "2016-07-28T19:24:50+00:00",
}]
```

**GET /customer/ id /tokens**

List all tokens belonging to a specific customer

**Authentication**

API token (/api/auth#tokens)
Request Example

GET /customer/:id/tokens
Fastly-Key: d3cafb4dde4d6eef
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json

[{
  "id": "5Yo3XXnrQpjc20u0ybrf2g",
  "user_id": "4y5K5trZocEAQYkesWlk7M",
  "service_id": null,
  "name": "my_token",
  "scope": "api-key",
  "created_at": "2016-06-22T03:19:48+00:00",
  "expires_at": "2016-07-28T19:24:50+00:00"
}]

GET /tokens/self

Get a single token based on the access_token used in the request.

Authentication

API token (/api/auth#tokens)

Request Example

GET /tokens/self
Fastly-Key: d3cafb4dde4d6eef
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json

{ "id": "5Yo3XXnrQpjc20u0ybrf2g",
  "user_id": "4y5K5trZocEAQYkesWlk7M",
  "service_id": null,
  "name": "my_token",
  "scope": "api-key",
  "created_at": "2016-06-22T03:19:48+00:00",
  "expires_at": "2016-07-28T19:24:50+00:00"
}
Create an API token. If two-factor authentication is enabled for your account, review the instructions (/api/auth#two-factor-authentication) for including a one-time password in the request.

Authentication

Username and password

Request Example

POST /tokens
Content-Type: application/x-www-form-urlencoded
Accept: application/json

"username=me@example.com&password=secret&service_id=5VqE6MOOy1QFJbgmCK41pY&expires_at=2016-07-28T19:24:50+00:00"

Response Example

HTTP/1.1 200 OK
Content-Type: application/json

{  "id": "5Yo3XXnrOpjc20u0ybrf2g",  "access_token": "d3caff4d4d4beef",  "user_id": "4y5K5trZocEAYQzesWlk7M",  "service_id": "5VqE6MOOy1QFJbgmCK41pY",  "name": "my_token",  "scope": "api-key",  "expires_at": "2016-07-28T19:24:50+00:00",  "created_at": "2016-06-22T03:19:48+00:00" }

DELETE /tokens/self

Revoke a token that is used to authenticate the request.

Authentication

API token (/api/auth#tokens)

Request Example

DELETE /tokens/self
Fastly-Key: d3caff4d4d4beef
Accept: application/json

Response Example

HTTP/1.1 204 No Content
Content-Type: application/json

DELETE /tokens/ id

Revoke a specific token by its id.
Authentication

API token (/api/auth#tokens)

Request Example

```
DELETE /tokens/5Yo3XXnr0pjc20u0ybrf2g
Fastly-Key: d3cafb4ddee4dbef
Accept: application/json
```

Response Example

```
HTTP/1.1 204 No Content
Content-Type: application/json
```

Troubleshooting

If the Fastly API returns an error message while you're working with API tokens, use the following information to troubleshoot the issue.

**POST /tokens**

An HTTP 400 response with a JSON body containing an error code is returned on error.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>invalid_grant</td>
<td>Supplied username/password combination is not correct</td>
</tr>
<tr>
<td>invalid_request</td>
<td>The username/password combination is not supplied. If you're using cURL on the command line, make sure the options are correct.</td>
</tr>
<tr>
<td>account_locked</td>
<td>Your account is locked.</td>
</tr>
<tr>
<td>2fa.verify</td>
<td>Your 2FA token is not supplied or is expired.</td>
</tr>
</tbody>
</table>

**GET /tokens**

- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.

**GET /tokens/self**

- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.

**DELETE /tokens/:token_id**

- An HTTP 400 response is returned on revocation error.
- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.
- An HTTP 404 response is returned on failed token lookup.
DELETE /tokens/self

- An HTTP 400 response is returned on revocation error.
- An HTTP 401 response is returned on expired token.
- An HTTP 403 response is returned on invalid access token.

API key

Include your API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) as a Fastly-Key header. For example:

```
GET /some/path
Host: https://api.fastly.com
Fastly-Key: d3cafb4dde4dbee
```

As a simplified cURL example, it would look like this:

```
curl -H "Fastly-Key: d3cafb4dde4dbee" https://api.fastly.com/some/path
```

Session

⚠️ IMPORTANT: This method will not work if you have Two Factor Authentication (/guides/account-management-and-security/enabling-and-disabling-two-factor-authentication) enabled on your account. You will need to use your full API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) for authentication.

Some API endpoints allow for session authentication. This is similar to how your web browser sends information back and forth to the Fastly Application (https://app.fastly.com/).

To gain a session token, first POST your user and password the /login endpoint with the parameters user and password. For example:

```
POST /login
Host: https://api.fastly.com
Content-Type: application/x-www-form-urlencoded

user=testowner@example.com&password=superSecretPassword
```

As a simplified cURL example:

```
curl -d "user=testowner@example.com&password=superSecretPassword" https://api.fastly.com/login
```

⚠️ NOTE: The -d argument will cause cURL to make the request a POST action with the supplied value as a standard application/x-www-form-urlencoded encoded payload. Depending on your framework, you may have to explicitly set the request to POST and set the Content-Type header.
This request will return a session ident in the `fastly.session` value in the form of a standard cookie format (https://en.wikipedia.org/wiki/HTTP_cookie) header.

Most utilities and frameworks include some facility for storing returned cookies, and for sending them with later requests.

Config (/api/config)

ACL

An ACL is a named access control list for matching against a client's IP address during VCL processing. A new ACL is empty and is attached to a working version of a service (not locked or active). The version associated with the ACL must be activated to be used. To remove an ACL from use, the ACL must be deleted from a working version (not locked or active), and that version without the ACL must be activated.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>-</td>
<td>Name for the ACL. Must start with alphanumeric and contain only alphanumeric, underscore, and whitespace.</td>

Overrides ssl_hostname, but only for SNI in the handshake. Does not affect cert validation at all.

### use_ssl

**boolean**

Whether or not to use SSL to reach the backend.

### version

**integer**

The current version number of a service.

### weight

**integer**

Weight used to load balance this backend against others.

Condition

Conditions are used to control when and how other objects are used in a service configuration. They contain a statement that evaluates to either true or false and is used to determine whether the condition is met.

Depending on the type of the condition, the statement field can make reference to the Varnish Variables `req`, `resp`, and/or `beresp`.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>

<tr>
<td>comment</td>
<td>string</td>
<td>Name of the condition.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name of the condition.</td>
</tr>
<tr>
<td>priority</td>
<td>integer</td>
<td>Priority assigned to condition. Order executes from 1 to 10, with 1 being first and 10 being last.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>statement</td>
<td>string</td>
<td>The statement used to determine if the condition is met.</td>
</tr>
<tr>
<td>type</td>
<td>string</td>
<td>Type of the condition, either &quot;REQUEST&quot; (req), &quot;RESPONSE&quot; (req, resp), or &quot;CACHE&quot; (req, beresp).</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

Actions

A Dictionary is a table that stores key value pairs accessible to VCL functions during VCL processing. A new dictionary is empty and attached to a working version of a service (not locked/active). In order for the dictionary to appear in generated VCL, the version associated with the dictionary must be activated. To remove a dictionary, the dictionary must be deleted on a working version (not locked/active), and that version without the dictionary then must be activated.

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/auth#session) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Request Example

DELETE /service/SU1Z0isxPaozGVKXdv0eY/version/1/dictionary/my_dictionary
Fastly-Key: d3cafb4d4dee4dbeeef
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json

{
  "status": "ok"
}

Dictionary Item

A DictionaryItem holds a key and value that make up an entry in a Dictionary. DictionaryItems are versionless so they can be modified without activating a new version.

Fields

<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>created_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the dictionary was created.</td>

<td>Time-stamp (GMT) when the dictionary was deleted.</td>
</tr>
<tr>
<td>dictionary_id</td>
<td>string</td>
<td>The dictionary for this Item.</td>
</tr>
<tr>
<td>item_key</td>
<td>string</td>
<td>Key for the DictionaryItem.</td>
</tr>
<tr>
<td>item_value</td>
<td>string</td>
<td>Value for the DictionaryItem.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The service the Dictionary belongs to.</td>
</tr>
<tr>
<td>updated_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the dictionary was updated.</td>
</tr>
</tbody>
</table>

Actions

GET /service/service_id/dictionary/dictionary_id/items
List of DictionaryItems given service and dictionary ID.

Authentication

**Director**

A Director is responsible for balancing requests among a group of Backends. In addition to simply balancing, Directors can be configured to attempt retrying failed requests. Additionally, Directors have a quorum setting which can be used to determine when the Director as a whole is considered "up", in order to prevent "server whack-a-mole" following an outage as servers come back up.

**Fields**

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>backends</td>
<td>array</td>
<td>List of backend associated with this director.</td>
</tr>
<tr>
<td>capacity</td>
<td>integer</td>
<td>Load balancing weight for the backends.</td>
</tr>
<tr>
<td>comment</td>
<td>string</td>
<td>Description field.</td>
</tr>
<tr>
<td>created_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the Director was created.</td>
</tr>
<tr>
<td>deleted_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the Director was deleted.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name for the Director.</td>
</tr>
<tr>
<td>quorum</td>
<td>integer</td>
<td>The percentage of capacity that needs to be up for a director to be considered up. Integer, 0 to 100 (default: 75)</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>shield</td>
<td>string</td>
<td>Selected POP to serve as a &quot;shield&quot; for origin servers.</td>
</tr>
<tr>
<td>type</td>
<td>integer</td>
<td>What type of load balance group to use. Integer, 1 to 4. Values: 1=random, 2=round-robin, 3=hash, 4=client. (default: 1)</td>
</tr>
<tr>
<td>updated_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the Director was updated.</td>
</tr>
</tbody>
</table>
**retries**  
integer  
How many backends to search if it fails. (default: 5)

**version**  
integer  
The current version of a service.

**Director Backend**

Maps and relates backends as belonging to directors. Backends can belong to any number of directors but directors can only hold one reference to a specific backend.

**Fields**

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>backend_name</td>
<td>string</td>
<td>Name of the backend to map to the specified director.</td>
</tr>
<tr>
<td>created_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the relationship was created.</td>
</tr>
<tr>
<td>deleted_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the relationship was deleted.</td>
</tr>
<tr>
<td>director</td>
<td>string</td>
<td>Name of the director.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>

<tr>
<td>updated_at</td>
<td>string</td>
<td>Time-stamp (GMT) when the relationship was updated.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

**Actions**

**GET** `/service/ service_id /version/ version /director/ director_name /backend/ backend_name`

Returns the relationship between a Backend and a Director. If the Backend has been associated with the Director, it returns a simple record indicating this. Otherwise, returns a 404.

**Authentication**
API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/auth#session) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>director_name</td>
<td>string</td>
<td>The director name.</td>
</tr>
</tbody>
</table>

Request Example

GET /service/SU1Z0isxPaozGVKXdv0eY/version/1/director/test-director/backend/test-backend HTTP/1.1
Fastly-Key: d3cafb4d4d5eef
Accept: application/json

Response Example

HTTP/1.1 200 OK
Content-Type: application/json; charset=utf-8

```
{
  "backend_name": "test-backend",
  "created_at": "2016-05-05T20:26:56+00:00",

  "version": 1
}
```

**POST** /service/ service_id /version/ version /director/ director_name /backend/ backend_name

Establishes a relationship between a Backend and a Director. The Backend is then considered a member of the Director and can be used to balance traffic onto.

Authentication

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/auth#session) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Parameters

<tbody>
<tr>
<td>director_name</td>
<td>string</td>
<td>The director name.</td>
</tr>
</tbody>
</table>

Request Example

POST /service/SU1Z0isxPaozGVKXdv0eY/version/1/director/test-director/backend/test-backend HTTP/1.1
Fastly-Key: d3cafb4d4d5eef
DELETE /service/service_id/version/director/director_name/backend/backend_name

Deletes the relationship between a Backend and a Director. The Backend is no longer considered a member of the Director and thus will not have traffic balanced onto it from this Director.

Authentication

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/auth#session) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

### Actions

**GET** `/service/service_id/version/version/domain/check_all`

Checks the status of all domains' DNS records for a Service Version. Returns an array of 3 items. The first is the details for the domain, the second is the current CNAME of the domain, and the third is a boolean indicating whether or not it has been properly setup to use Fastly.

### Authentication

API key ([guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key](https://docs.fastly.com/api/aio#finding-and-regenerating-your-api-key)) or session cookie ([api/auth#session](https://docs.fastly.com/api/aio#session)) with at least [Engineer](https://docs.fastly.com/api/aio#engineer) permissions ([guides/user-access-and-control/user-roles-and-how-to-change-them](https://docs.fastly.com/api/aio#user-roles-and-how-to-change-them)).

### Request Example

```plaintext
GET /service/SU1Z0isxPaozGVXdv0eY/version/1/domain/check_all
Fastly-Key: d3cafb4d4e4db0f
Accept: application/json
```

Healthcheck

Healthchecks are used to customize the way Fastly checks on your Backends. If an origin server is marked unhealthy due to health checks, Fastly will stop attempting to send requests to it. If all origin servers are marked unhealthy, Fastly will attempt to serve stale. If no stale object is available, a 503 will be returned to the client.

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/auth#session) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Parameters
### Delete Healthcheck

**Delete** /service/service_id/version/healthcheck

Delete the healthcheck for a particular service and version.

#### Authentication

API key (/guides/account-management-and-security=finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/auth#session) with at least **Engineer** permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

#### Request Example

```
DELETE /service/SU1Z0isxPaozGVKXdv0eY/version/1/healthcheck
Fastly-Key: d3cafb4d4d4beef
Accept: application/json
```

#### Response Example

```
HTTP/1.1 200 OK
```

**Parameter**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_name</td>
<td>string</td>
<td>Old name of the healthcheck object (used to select the correct healthcheck object if the name has been changed).</td>
</tr>
</tbody>
</table>
Content-Type: application/json
{
  "status":"ok"
}

Request Settings

Settings used to customize Fastly’s request handling. When used with Conditions the Request Settings object allows you to fine tune how specific types of requests are handled.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>string</td>
<td>Allows you to terminate request handling and immediately perform an action. When set it can be lookup or pass (ignore the cache completely).</td>
</tr>
<tr>
<td>bypass_busy_wait</td>
<td>boolean</td>
<td>Disable collapsed forwarding, so you don’t wait for other objects to origin.</td>
</tr>
<tr>
<td>default_host</td>
<td>string</td>
<td>Sets the host header.</td>
</tr>
<tr>
<td>force_miss</td>
<td>boolean</td>
<td>Allows you to force a cache miss for the request. Replaces the item in the cache if the content is cacheable.</td>
</tr>
<tr>
<td>force_ssl</td>
<td>boolean</td>
<td>Forces the request use SSL (redirects a non-SSL to SSL).</td>
</tr>
<tr>
<td>geo_headers</td>
<td>boolean</td>
<td>Injects Fastly-Geo-Country, Fastly-Geo-City, and Fastly-Geo-Region into the request headers.</td>
</tr>
<tr>
<td>hash_keys</td>
<td>string</td>
<td>Comma separated list of varnish request object fields that should be in the hash key.</td>
</tr>
<tr>
<td>max_stale_age</td>
<td>integer</td>
<td>How old an object is allowed to be to serve stale-if-error or stale-while-revalidate.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name for the request settings.</td>
</tr>
<tr>
<td>request_condition</td>
<td>string</td>
<td>Name of condition object used to test whether or not these settings should be used.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>timer_support</td>
<td>boolean</td>
<td>Injects the X-Timer info into the request for viewing origin fetch durations.</td>
</tr>
</tbody>
</table>
**version** | integer | The current version of a service.
--- | --- | ---
**xff** | string | Short for X-Forwarded-For, should be clear, leave, append, append_all, or overwrite.

**Actions**

**GET** /service/service_id/version/version/request_settings

Returns a list of all Request Settings objects for the given service and version.

**Authentication**

<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>content_type</td>
<td>string</td>
<td>The MIME type of the content, can be empty.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name that identifies the Response Object.</td>
</tr>
<tr>
<td>status</td>
<td>string</td>
<td>The HTTP Status Code, defaults to 200.</td>
</tr>
<tr>
<td>response</td>
<td>string</td>
<td>The HTTP Response, defaults to &quot;Ok&quot;</td>
</tr>
<tr>
<td>request_condition</td>
<td>string</td>
<td>Name of the condition to be checked during the request phase. If the condition passes then this object will be delivered.</td>
</tr>
<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

**Actions**

**GET** /service/ **service_id** /version/ **version** /response_object

Returns all Response Objects for the specified service and version.

<tr>
<td>service_id</td>
<td>string</td>
<td>The alphanumeric string identifying a service.</td>
</tr>
<tr>
<td>version</td>
<td>integer</td>
<td>The current version of a service.</td>
</tr>
</tbody>
</table>

### Actions

```http
get /service/service_id /version/ version /settings
```

Get the settings for a particular service and version

Authentication

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/auth#session) with at least Engineer permissions (/guides/user-access-and-control/user-roles-and-how-to-change-them).

Request Example

```http

}
```

**Stats**

Stats give you information on the usage and performance of your Service. They can be request by Service and over a particular time span. Stats are broken down per datacenter, giving you information on how your Services are being used across the world. There is now a more flexible, and fully featured Stats API (/api/stats) available

**Fields**
<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_time</td>
<td>integer</td>
<td>Epoch timestamp for period request</td>
</tr>
<tr>
<td>end_time</td>
<td>integer</td>
<td>Epoch timestamp for period request</td>
</tr>
<tr>
<td>year</td>
<td>integer</td>
<td>Summarize a specific Y/M (requires month)</td>
</tr>
<tr>
<td>month</td>
<td>integer</td>
<td>Summarize a specific month (requires year)</td>
</tr>
</tbody>
</table>

**Actions**

**GET** /service/ service_id /stats/summary

Get the stats from a service for a block of time. This lists all stats by PoP location, starting with AMS. This call requires parameters to select block of time to query. Use either a timestamp range (using **start_time** and **end_time**) or a specified month/year combo (using **month** and **year**)

**Authentication**

API key (/guides/account-management-and-security/finding-and-managing-your-account-info#finding-and-regenerating-your-api-key) or session cookie (/api/auth#session).

**Request Example**

```
GET /service/SU120isxPaozGVKXdv0eY/stats/summary?year=2013&month=7
Fastly-Key: d3caf4d4d4beef
Accept: application/json
```

**Response Example**

Version

A Version represents a specific instance of the configuration for a service. A Version can be cloned, locked, activated, or deactivated.

Fields

<table>
<thead>
<tr>
<th>field</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
</table>

https://docs.fastly.com/api/aio
### active
*boolean*
Whether this is the active version or not.

### comment
*string*
A comment.

### created_at
*string*
Time-stamp (GMT) when the version was created.

### deleted_at
*string*
Time-stamp (GMT) when the version was deleted.

### deployed
*boolean*
Whether or not this version is deployed.

### locked
*boolean*
Whether this version is locked or not. Objects can not be added or edited on locked versions.

### number
*integer*
The number of this version.

### service_id
*string*
The alphanumeric string identifying a service.

### staging
*boolean*
Whether or not this version is for staging.

### testing
*boolean*
Whether or not this version is for testing.

### updated_at
*string*
Time-stamp (GMT) when the version was updated.

**Soft Purging**

https://docs.fastly.com/api/aio
Soft Purging sets an object's TTL to 0s, forcing revalidation. For best results, Soft Purging should be used in conjunction with stale_while_revalidate and stale_if_error. The main entry point http://api.fastly.com/ for the API is not needed for a single URL Soft Purge.

**Actions**

**PURGE */

Soft Purge an individual URL.

**Authentication**

Disabled by default. See Authenticating URL purge requests via API (/guides/purging/authenticating-api-purge-requests) to enable.

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>type</th>
<th>description</th>
</tr>

Historical Stats (/api/stats)
The Fastly Historical Stats API (i.e., the Stats API) is a RESTful API that allows Fastly customers to query historical caching stats such as number of requests, hit ratio, and number of errors. The Stats API provides an advanced querying interface that allows for fine grained time period, regional, and sampling control. This document provides a basic overview of Stats and documents all available endpoints.

Using the Stats API
The stats API is accessible from https://api.fastly.com/stats/*, and can be used with both Fastly Key and Username / Password authentication. Authentication works exactly as it does for the Core Fastly API, please refer to Authentication Documentation (/api/auth) for further details. Here is an example using the command-line tool CURL:

```bash
curl -H "Fastly-Key: YOUR_API_KEY" https://api.fastly.com/stats/usage
```

To find your API key please visit the "Account" section in the Fastly Application. Your organization's API key should be displayed at the top left of the page under the heading "API Key". If the API key does not appear, then you may not be authorized to view the key and you should ask the person within your organization that setup the Fastly account. If all else fails you can contact support (https://www.fastly.com/support) and ask to receive your API key.

Query Options (Time Range, Sampling Rate, and Regions)
There are four query parameters that you can use to specify what information is returned by the stats API. The `from` and `to` parameters control the window over which you want to fetch stats information. The `by` controls the sampling rate (day, hour, or minute). And the `region` parameter allows you to restrict the result set to a particular region.

**Param: from and to**

The `from` and `to` parameters are exact times that control the window over which to fetch historical statistics. By default you can use UNIX timestamps when specifying these parameters, but many forms of human readable inputs are also available, such as:

- Yesterday
- Two weeks ago
- 2/20/2013
Date parsing is performed using the Chronic ruby library; for the most detailed information on exactly what formats are available please visit the gem’s GitHub page (https://github.com/mojombo/chronic). Let’s see some examples:

```
/stats?from=10+days+ago
```

Returns stats for each of your services, by day, for the last ten days

```
/stats?from=10+days+ago
```

Stats from Tuesday 14th May 2013 @ 20:29:37pm UTC to Thursday 16th May 2013 @ 20:29:37pm UTC

```
/stats?from=1/1/2013&to=2/1/2013/
```

Daily stats from January 1st, 2013 (1/1/2013) to February 1st, 2013

It is important to note that the `from` parameter is "inclusive" and the `to` parameter is "exclusive". This means that we will return only rows with recorded times that match the following inequality:

```
from <= recorded < to
```

NOTE: We store historical stats information using UTC, and not local time zones. This means that we will use the UTC interpretations of your inputs when querying stats information.

**Param: `by`**

The `by` parameter allows you to control the sampling rate used to produce the result set from querying the Stats API. There are three values that can be set:

- **minute** - Stats will be sampled by minute for each recorded minute in the specified window
- **hour** - Sample by hour within the specified window
- **day** - Sample by day within the specified window

If you do not provide a `by` parameter in your query it will default to 'day'. Each sampling rate also specifies default `to` and `from` parameters if you omit them:

Each value for the `by` parameter has associated defaults for the `to` and `from` parameters if they are omitted, here’s an overview:

```
/stats
```

Defaults to: By day, from 1 month ago, to now

```
/stats?by=hour
```

https://docs.fastly.com/api/aio
Defaults to: by hour, from 1 day ago, to now

/stats?by=minute

Defaults to: by minute, from 30 minutes ago, to now

It is important to remember the following conversions when performing queries:

- 1 day = 24 hours
- 1 hour = 60 minutes
- 1 day = 60 * 24 = 1,440 minutes

When changing the sampling rate via the `by` parameter you can accidentally ask for very large data sets if you have defined `to` and `from` parameters. We will not process exceedingly large queries. Please refer to the Response Format section below for more details.

**Param:** `region`

The Stats API also allows you to limit the scope of your query by restricting it to a particular region. This is achieved via the use of the `region` parameter. Currently the following regions are supported:

- **usa** - Restricts the query to statistics reported by continental United States POPs (Points of Presence)
- **europe** - Restricts the query to statistics reported by European POPs
- **anzac** - Restricts the query to Australia / New Zealand / Asia / Pacific POPs

Usage is exceedingly simple, let's look at some examples:

```
/stats
```

Returns stats for all regions

```
/stats?region=usa
```

Returns stats for only US POPs

```
/stats?region=europe
```

Returns stats for European POPs only

The list of regions will always contain the ones listed above but may grow as Fastly expands into new parts of the globe. Because the list is dynamic, please use the following endpoint to get a list of all available regions:

`https://docs.fastly.com/api/aio`
GET /stats/regions

See the API section below for example output

It is important to note that not all regions are available to all customers at this time. If you need support for a particular region please feel free to contact us via our helpdesk (https://www.fastly.com/support).

Response Format

To make it easier to understand how a query is being processed we use a specific JSON response format. Here is an example:

```
/stats?from=1+day+ago
```

```
{
  "status": "success",
  "meta": {
    "to": "Thu May 16 20:08:35 UTC 2013",
    "from": "Wed May 15 20:08:35 UTC 2013",
    "by": "day",
    "region": "all"
  },
  "msg": null,
  "data": [ ... ]
}
```

Each of the fields denotes the following:

- **status** - Whether or not we were able to successfully execute the query
- **meta** - Meta information about the scope of the query in a human readable format
- **msg** - If the query was not successful this will provide a string that explains why
- **data** - This contains the actual results of the query that we processed

Availability of Data

The collection and processing of statistics information from a globally distributed CDN, such as Fastly, is not instantaneous. Thus there will be a notable delay as to when certain sampling range information will be up to date. Here are the general guidelines:

1. Minutely data will be delayed by roughly 10 to 15 minutes from the current time
2. Hourly data will be delayed by the same amount, and the current hour will return a partial result (because the hour has not finished but we are incrementally aggregating data)
3. Daily data works similarly to hourly data and the current day will also represent a partial result
